

WATER YOU CAN TRUST FOR LIFE

Water plays a key role in your health and Des Moines Water Works (DMWW) plays a key role in providing **WATER YOU CAN TRUST FOR LIFE**.

DMWW operates three water treatment plants in central Iowa. The newest facility, Saylorville Water Treatment Plant located in northern Polk County, began serving water to residents north of Des Moines April 2011. This facility utilizes membrane technology to soften and purify the finished water. It is DMWW's first membrane treatment plant and the largest such facility in Iowa.

The L.D. McMullen Treatment Facility at Maffitt Reservoir, located southwest of the metro area, treats water from the Raccoon River, and serves customers in southwest Des Moines, parts of Xenia and Warren Water Systems, Waukee and parts of Clive, Urbandale and West Des Moines. The water is obtained through radial collector wells located horizontally in the coarse sand and gravel formation beneath the river. The shallow groundwater receives natural filtration prior to entry into the wells. The groundwater is pumped to the treatment plant via a series of pipes and pumps that interconnect all six of the wells and the horizontally drilled well. This innovative horizontal well formation was designed and constructed by DMWW staff.

All other areas in Des Moines Water Works' service area receive water from the Fleur Drive Treatment Plant. This plant treats water pumped from one of three sources: Raccoon River, Des Moines River and an infiltration gallery (a series of underground pipes situated next to the Raccoon River located throughout Water Works Park).

DMWW's chemists and microbiologists test the untreated water daily to determine the best source water. They also test the treated water every day to ensure that it is a healthy and safe product. The tests include bacterial analysis, softening levels and testing for other contaminants.

Once treated, there are more than 1,300 miles of underground water mains and pipe (iron, concrete and plastic) distributing the water to homes in Des Moines and surrounding communities.

live healthy. be green. drink tap.

DEFINITION OF TERMS

Coliform A bacteria originating in the digestive system of mammals. Its presence in water alerts lab staff that disease-causing agents may be present.

Level Found The highest amount found in the water or the average of all samples analyzed, depending on the regulation. If multiple samples were tested in 2011, the lowest and highest detected values are listed under Range of Detections.

mg/L milligrams per liter, or parts per million (**ppm**). Parts of contaminant per million parts of water. One part per million is equivalent to a single penny in ten thousand dollars.

MCL The maximum contaminant level, the highest level of a substance allowed in drinking water

MCLG The MCL Goal, the level of a substance where there is no known or expected health risk. MCLGs allow for a margin of safety. MCLs are set as close to MCLGs as feasible using the best available treatment processes.

N/A not applicable.

ND not detected.

NTU nephelometric turbidity units.

pCi/L picocuries per liter, a measure of radioactivity.

TT Treatment technology. Certain treatment processes are required to reduce the level of turbidity in the drinking water. Turbidity must not ever exceed 1 NTU, and must be less than 0.3 NTU 95% of the time.

Turbidity Turbidity is a measure of cloudiness of the water. It is monitored because it is a good indicator of the effectiveness of the filtration system.

ug/L micrograms per liter, or parts per billion (**ppb**). Parts of contaminant per billion parts of water. One part per billion is equivalent to a single penny in ten million dollars.

SOURCE WATER REPORT

Des Moines Water Works obtains water from one or more surface waters. Surface water sources are susceptible to sources of contamination within the drainage basin.

Surface Water Name	Susceptibility
Crystal Lake	High
Des Moines River	High
Maffitt Lake	High
Raccoon River	High

Des Moines Water Works completed a **SOURCE WATER ASSESSMENT** in 2001. To obtain a copy of the assessment, call (515) 283-8700 to request a printed copy.

2012 CONSUMER CONFIDENCE REPORT

A publication on quality water and quality service presented by
DES MOINES WATER WORKS

SOURCE

TREATMENT

DISTRIBUTION

Supplying central Iowa with clean, safe drinking water is Des Moines Water Works' mission. In order to ensure tap water is safe to drink, the Environmental Protection Agency (EPA) prescribes regulations that limit the amount of certain contaminants in water provided by public water systems.

Water supplied by Des Moines Water Works continues to meet or exceed all state and federal drinking water standards. This annual water quality report is your guide to the quality and safety of tap water provided by Des Moines Water Works.

Des Moines Water Works ensures our customers have a reliable, secure water supply. To achieve that, we continuously invest in maintenance and upgrades to our infrastructure. We closely monitor the water supply to identify and treat any contaminants and regularly review treatment methods and operations for efficiency. Des

Moines Water Works' extensive monitoring program allows us to evaluate our ever-challenging source waters, treat it effectively and deliver **WATER YOU CAN TRUST FOR LIFE**.

DRINKING WATER AND HEALTH INFORMATION FROM THE EPA

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice from their healthcare providers about drinking water. The EPA and Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the national Safe Drinking Water Hotline (800) 426-4791.

Nitrate in drinking water at levels above 10 ppm is a health risk for infants less than six months of age. High nitrate levels in drinking water can cause blue baby syndrome. Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity. Des Moines Water Works uses a variety of strategies to keep the treated tap water below 10 ppm. These strategies include source water blending, and if necessary, removal of nitrate using a treatment process known as ion exchange. Des Moines Water Works' treated water has not exceeded the 10 ppm standard since nitrate removal was implemented in 1992. If you are caring for an infant, you should ask for advice from your healthcare provider.

Many customers wish to know if bottled water is safer than regular tap water. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water that must provide the same protection for public health. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. Research repeatedly shows bottled water to be no safer than conventional tap water provided by public water systems in the U.S.

More information about contaminants and potential health effects can be obtained by contacting the EPA's Safe Drinking Water Hotline at **(800) 426-4791** or <http://water.epa.gov/drink>.

2011 WATER QUALITY RESULTS

Water Treatment Plant Monitoring

TOTAL ORGANIC CARBON RESULTS

Treatment Plant	Year Tested	Annual Removal Ratio	Minimum Removal Requirement
Fleur Drive Plant	2011	2.38	1.00
McMullen Facility	2011	1.63	1.00
Saylorville Plant	2011	2.00	1.00

Definitions for terms and measurement units can be found on the back page.

Before water can be delivered to your home, it must first be analyzed by certified laboratories at Des Moines Water Works' Fleur Drive Treatment Plant and at the University of Iowa Hygienic Laboratory in Iowa City. Results for 2011 in this report include samples taken as water leaves Des Moines Water Works' three treatment plants and from samples obtained from the various water distribution systems supplied with water by Des Moines Water Works.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring material and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or humans. Contaminants that may be present in source water include:

- **Microorganisms** such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
- **Inorganic Contaminants** such as salts and metals, which can occur naturally or come from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- **Pesticides and Herbicides** which may come from agriculture, urban stormwater runoff and residential uses.
- **Organic Chemicals** including synthetic and volatile organic chemicals, which are industrial and petroleum process byproducts and can also come from gas stations, urban stormwater runoff and septic systems.
- **Radioactive Contaminants** which can occur naturally or result from oil and gas production and mining activities.

Distribution System Monitoring

Once the water leaves the water treatment facilities, it is regularly monitored throughout the numerous distribution systems served by Des Moines Water Works for disinfectant, disinfectant byproducts, bacteria, lead and copper. The table below shows the results of this monitoring.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Des Moines Water Works is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure are available from the **Safe Drinking Water Hotline at (800) 426-4791 or <http://water.epa.gov/drink>**.
