All private and public fire hydrants must have a fire hydrant inspection report on file, or in the possession of the property owner. Using a fire hydrant without proper authorization is considered theft of service and will be prosecuted as such.

The Drinking Water Source Protection Plan for Logan City is available for your review. It contains information about sources, potential contamination sources, and management strategies. The purpose of the plan is to protect our drinking water supply from contamination, including human and animal sources, industrial areas, and non-typical sources. We have also developed management strategies to further protect our water sources from contamination. All sources of water are subject to potential contamination by various sources, and we are continuously working to improve our water system's quality.

Cross Connection

There are many cross connections in our water distribution system. We look out for and reported cross connections to the Drinking Water Quality Protection Agency's Safe Drinking Water Hotline at 1-800-476-7491.

So, what can you do? Do not make or allow improper connections at your homes. Even that one improperly connected appliance can seriously affect the quality of the water supply system. The quality of your water is at risk when you have a cross connection.

Our constant goal is to provide you with a safe and dependable water supply. To maintain a drinking water system, we need to work together. The Drinking Water Quality Guidelines are designed to protect the water system from contamination and other domestic use. In addition, the Department of Health has provided guidelines to protect public drinking water systems from cross connections. These guidelines include recommendations for the operation and maintenance of the water system and are also provided in writing to the Board.
LOGAN CITY MONITORS IN-MCL OF CON

All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some constituents. It’s important to remember that the presence of these constituents does not necessarily pose a health risk.

If you have any questions about this report or concerning your water utility, please contact Michael Rundoy (mroudoy@loganutah.org) or 435-716-9620. We want our valued customers to be informed about their water utility. If you want to learn more, please attend any of our water board meetings. They are held on the third Thursday of every month at 4:00 pm at 950 W 600 N. These meetings are open to the public. Please call 435-716-9620 to verify meeting time and location.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline 1-800-426-4791.

MCLs are set at very stringent levels. To understand the possible health effects described for many regulated constituents, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of having the described health effect.
