PUBLIC RECORDS REQUEST

To:	Southington Clerk
From:	Nathan Kerpez, Environmental Analyst
Date:	1/9/25
Re:	Public Records Request/FOIA LCS Project No. 24.09518.39

LCS, Inc. is completing an Environmental Site Assessment for a property within Southington Clerk addressed at 1268 West Street, Southington, Connecticut. We are requesting a review of Southington Clerk files for this property to identify any of the following records, if available:

1. Date the current building was constructed
2. Current and/or previous uses and occupants
3. Building, zoning, and/or fire department permits and/or inspections
4. Environmental enforcement actions, complaints, notices of violations, spills/releases, clean-ups, etc.
5. Underground/aboveground storage tanks or other underground features
6. Use of hazardous materials
7. Old/historical property record cards (prior to electronic records)
8. Code violations

If records are found, electronic delivery via email is preferred; otherwise, please contact me to discuss scheduling a file review at your office. Please also contact me in advance if any copy fees apply. **My contact information is as follows: nkerpez@lenderconsulting.com.**

Sincerely,

Nathan Kerpez
Environmental Analyst

DRAINAGE REPORT
The Learning Experience
1268 West Street
Southington, CT

November 7, 2022
Revised January 30, 2023

I. INTRODUCTION

A. Project Description

Southington West Street LLC and The Learning Experience are proposing the development of a 10,000 s.f. daycare center at 1268 West Street near the intersection of West Street (CT Rte. 229) and Churchill Street in Southington. The development will result in an impervious area of approximately 0.93 acres. Catch basins and piping will collect and convey stormwater from the building and parking lot to a proposed stormwater infiltration basin to provide water quality treatment and mitigate increases in peak flow resulting from the proposed impervious area.

B. Existing Conditions

The project site consists of an existing 2.7-acre parcel at 1268 West Street. The parcel is located on the western side of West Street approximately 500 feet north of the intersection with Churchill Street. Currently, the parcel is occupied by an abandoned house with overgrown lawn and woods. Runoff from the parcel is split along a north-south ridge near the center of the parcel. Runoff on the west flows off-site at the southwest corner. Runoff on the east flows towards the street and into the street's catch basin.

Based on a review of the USDA Soil Survey of Connecticut, the soil in the area to be developed consists of Cheshire fine sandy loam (see Soils Map in Appendix 1). The USDA Soil Survey defines groups of soils into Hydrologic Soil Groups (HSG) according to their runoff-producing characteristics. Soils are assigned to four groups (A, B, C, and D Groups). In group A, are soils having a high infiltration rate when thoroughly wet and having a low runoff potential. They typically are deep, well drained, and sandy or gravelly. In group D, at the other extreme, are soils having a very slow infiltration rate and thus a high runoff potential. They have a hardpan or clay layer at or near the surface, have a permanent high water table, or are shallow over nearly impervious bedrock or other nearly impervious material. The classification of the Cheshire fine sandy loam is HSG B.

On September 28, 2022, a series of 7 test pits were performed on-site to confirm the existing soil conditions. Test pits were excavated to depths ranging from 62-90 inches. Soils encountered included 9-11 inches of topsoil over medium brown fine sandy loam subsoils to a depth of 28-30 inches, overlying red-brown sand and gravel. No soil mottling indicative of the seasonal high water table were encountered in any of the test pits. Test pit logs are provided on the Site Plans.

II. STORMWATER RUNOFF ANALYSIS

A. Methodology

Peak runoff flow rates were determined for pre- and post-development conditions using Applied Microcomputer System's HydroCAD™ Stormwater Modeling System. This computer software employs the SCS Technical Release 55 and 20 (TR-55 & TR-20) methodology. The potential stormwater impacts downstream were evaluated for the 2-yr, 10-yr, 25-yr, and 100-yr; 24-hour

storm events. The rainfall for these storm events was taken from NOAA Atlas 14 provided in Appendix 2. Based on the present drainage patterns, runoff from the site flows either west off-site or east into the streets. As a result, the street and the western property line were selected as the two design points.

B. Pre-Development Hydrology

The pre-development site was modeled as two subcatchments. Subcatchment EX W includes the approximately 1.55 acres that runs off-site across the western property line. Subcatchment EX E includes the approximately 1.22 acres that runs east into the streets drainage system. The pre-development drainage area map is provided in Appendix 3. The pre-development runoff characteristics of the contributing area is provided on the HydroCAD data sheets in Appendix 4. The pre-development discharge rates from the site during the design storms are summarized in Tables 1 & 2.

C. Post-Development Hydrology

The proposed project will result in approximately 0.93 acres of new impervious area. In order to mitigate the increase in runoff resulting from the increase in impervious area, the development will include a series of catch basins and piping to collect runoff and convey it to a new infiltration basin. The infiltration basin has been designed in accordance with the CT Storm Water Quality Manual to provide treatment, groundwater recharge, and peak flow attenuation. Based on the loamy sand encountered in the test pits, a Rawls Rate of 2.41 inches/hour was selected for the design infiltration rate of the infiltration basin.

The infiltration basin will be equipped with a forebay separated from the main part of the basin by a stone filter berm. The bottom of the basin will be set at elevation 271. The basin will be equipped with a multi-stage outlet structure constructed from a 2'x2' pre-cast concrete yard drain. The structure's primary outlet will be an 8" orifice at elevation 273.30. The frame and grate at the top of the structure set at elevation 275.0 will act as the emergency spillway to allow stormwater discharge should flow through the primary weir be impeded. The structure will discharge via a 15" outlet pipe to an existing catch basin in the street. The proposed storage capacities of the infiltration basin below the primary outlet was sized to exceed the water quality volume. Likewise, the basin forebay was sized to contain a minimum of 25% of the WQV per the requirements for infiltration basins. WQV calculations are provided in Appendix 5.

The same design points for the pre-development analysis were used for the post development analysis. The post development site was divided into 6 subcatchments. Subcatchments S1 and S2 include the areas that will be collected by the catch basins in the parking lot and driveway that will be diverted to the infiltration basin. Subcatchment S3 includes the roof runoff that will be discharged directly into the infiltration basin. Subcatchment S4 includes the area that will sheet flow directly into the infiltration basin. Subcatchment S5 includes the area that will continue to drain overland directly to the street design point. Subcatchment S6 includes the area that will continue to drain overland directly to the western design point.

The post development drainage area map is provided in Appendix 3. The post development runoff characteristics of the subcatchments are provided on the HydroCAD data sheets in Appendix 4. As shown in Tables 1 & 2, the post-development peak rates of runoff from the site to the design points will be maintained or reduced in comparison to the pre-development rates.

TABLE 1 – COMPARISON OF PRE- & POST-DEVELOPMENT DISCHARGE RATES (CFS) TO WEST DESIGN POINT

	2-year	10-year	25-year	100-year
Pre-Development	0.49	2.11	3.36	5.52
Post Development	0.47	1.75	2.73	4.37

TABLE 2 – COMPARISON OF PRE- & POST-DEVELOPMENT DISCHARGE RATES (CFS) TO EAST (STREET) DESIGN POINT

	2-year	10-year	25-year	100-year
Pre-Development	0.37	1.56	2.48	4.07
Post Development	0.32	1.01	1.91	3.50

D. Pipe Sizing

The piping proposed at the site consists of smooth bore corrugated high density polyethylene pipe with smooth interior walls (CPEP-S). The roughness coefficient used for this pipe type is 0.012. The analysis provided in Appendix 4 indicates headwater elevation in the structure at each pipe inlet for the design storms and compares it to the flood elevation, which corresponds to the top of frame of the structure. The calculations indicate that all proposed pipes will have sufficient capacity to convey the 100-year storm event without surcharging out of the top of the structures.

E. Outlet Protection

Outfall protection for the pipe discharge from the catch basins will consist of a Type A riprap apron in the bottom of the sediment forebay. Outfall protection for the roof leader discharge into the basin will consist of a stone splash pad.

F. Summary of Results

The proposed design and analysis indicates that the proposed development will not result in negative impacts downstream of the site.

63B	Cheshire fine sandy loam, 3 to 8 percent slopes	4.1	100.0%
Totals for Area of Interest		**4.1**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

State of Connecticut

63B—Cheshire fine sandy loam, 3 to 8 percent slopes

Map Unit Setting

National map unit symbol: 9lpw
Elevation: 0 to 1,200 feet
Mean annual precipitation: 43 to 54 inches
Mean annual air temperature: 45 to 55 degrees F
Frost-free period: 140 to 185 days
Farmland classification: All areas are prime farmland

Map Unit Composition

Cheshire and similar soils: 80 percent
Minor components: 20 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Cheshire

Setting

Landform: Till plains, hills
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Coarse-loamy melt-out till derived from basalt and/or sandstone and shale

Typical profile

Ap - 0 to 8 inches: fine sandy loam
Bw1 - 8 to 16 inches: fine sandy loam
Bw2 - 16 to 26 inches: fine sandy loam
C - 26 to 65 inches: gravelly sandy loam

Properties and qualities

Slope: 3 to 8 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Low
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Moderate (about 7.8 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 2e
Hydrologic Soil Group: B
Ecological site: F145XY013CT - Well Drained Till Uplands
Hydric soil rating: No

Minor Components

Wilbraham

Percent of map unit: 5 percent
Landform: Drainageways, depressions

Down-slope shape: Concave
Across-slope shape: Concave
Hydric soil rating: Yes

Yalesville

Percent of map unit: 3 percent
Landform: Ridges, hills
Down-slope shape: Convex
Across-slope shape: Linear
Hydric soil rating: No

Wethersfield

Percent of map unit: 3 percent
Landform: Hills, drumlins
Down-slope shape: Linear
Across-slope shape: Convex
Hydric soil rating: No

Watchaug

Percent of map unit: 3 percent
Landform: Till plains, hills
Down-slope shape: Linear
Across-slope shape: Concave
Hydric soil rating: No

Menlo

Percent of map unit: 2 percent
Landform: Drainageways, depressions
Down-slope shape: Concave
Across-slope shape: Concave
Hydric soil rating: Yes

Unnamed, brown subsoil

Percent of map unit: 2 percent
Hydric soil rating: No

Unnamed, less sloping

Percent of map unit: 2 percent
Hydric soil rating: No

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

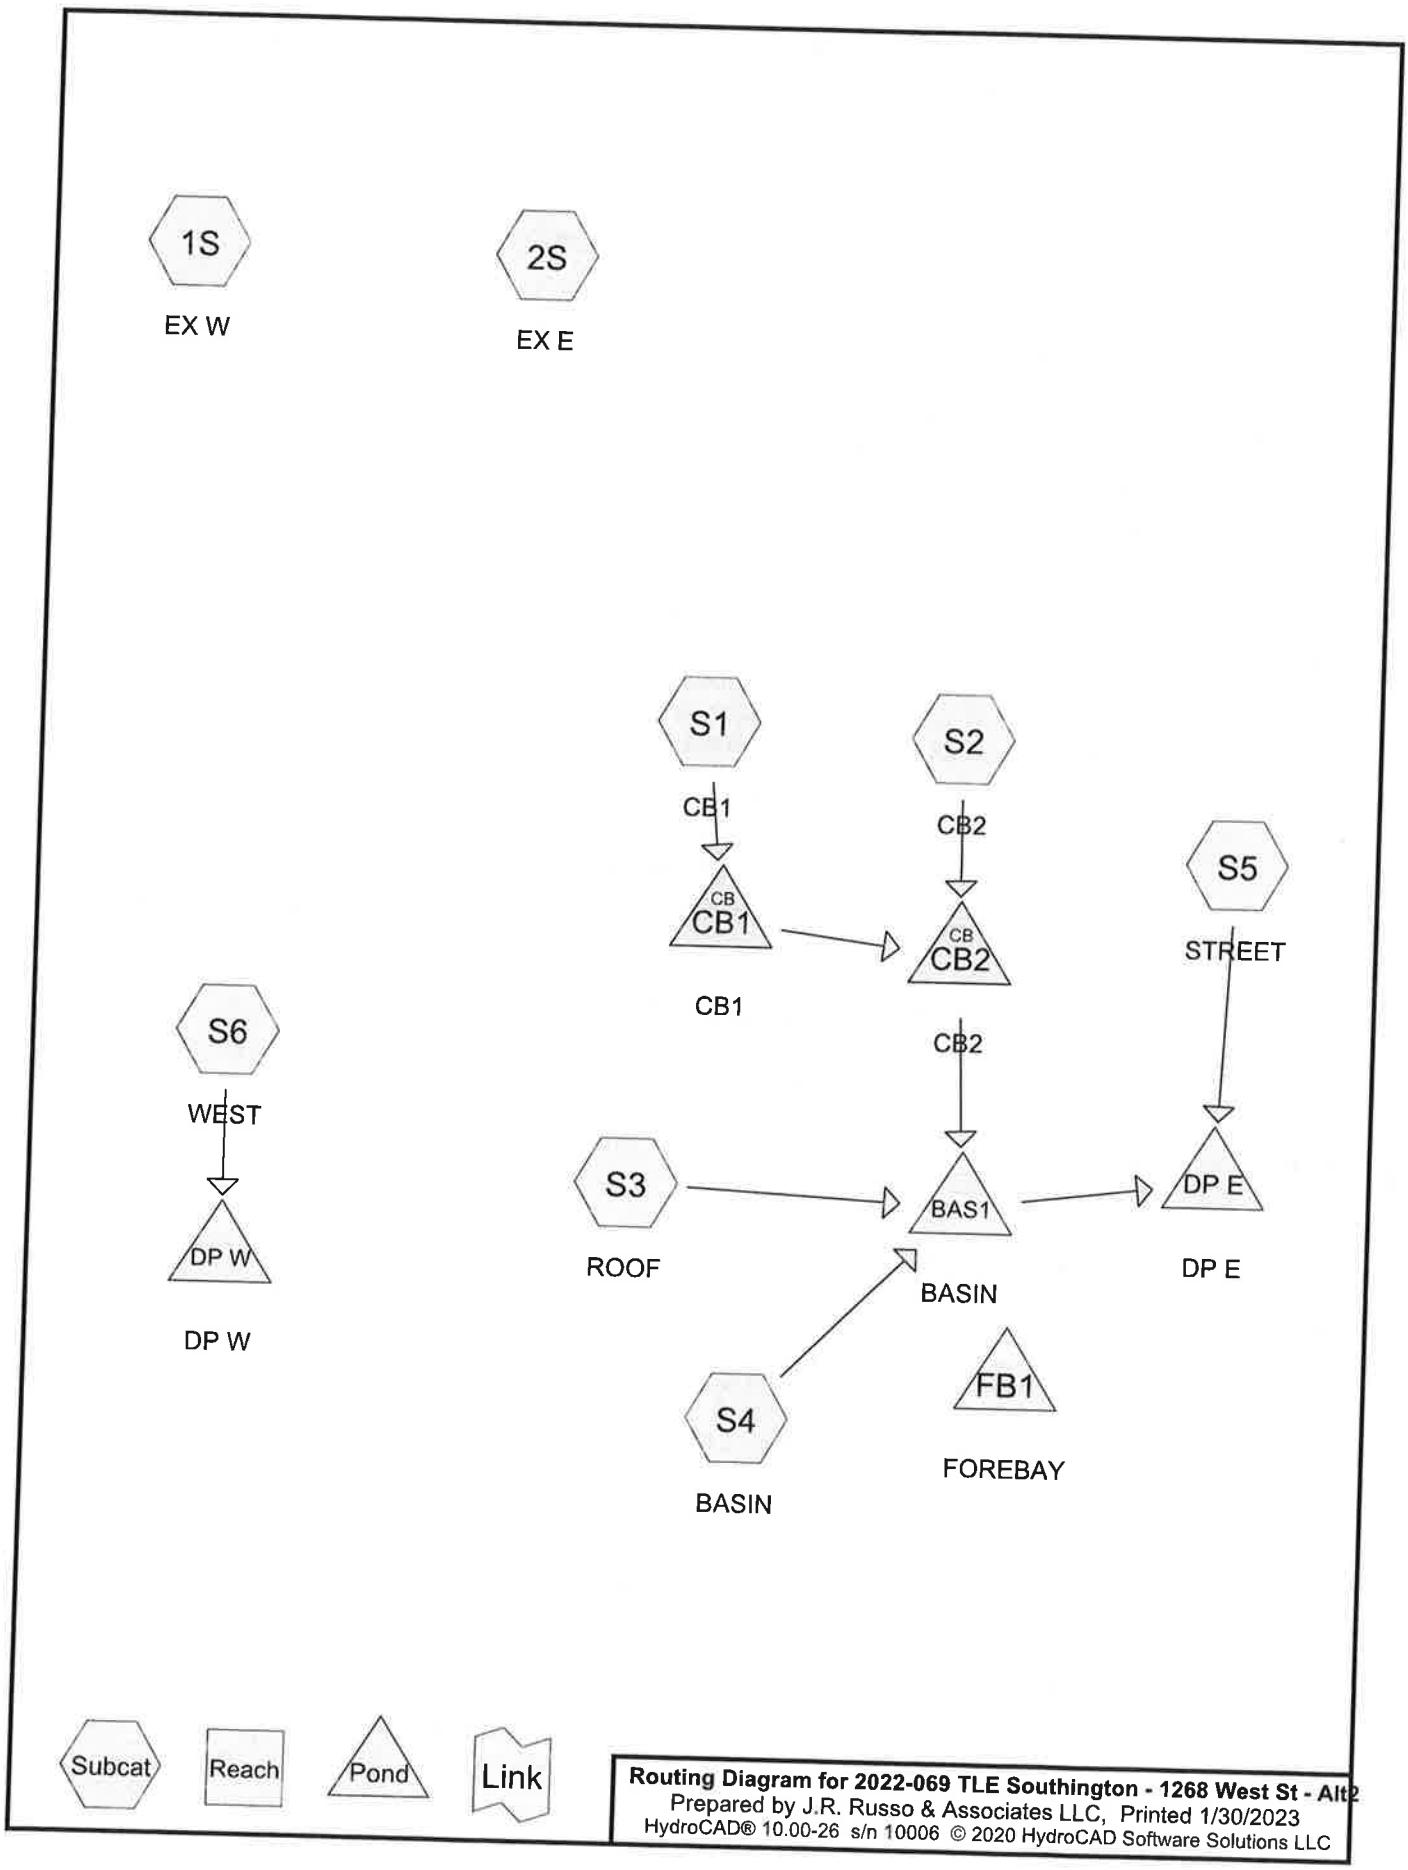
HYDROCAD ANALYSES



Routing Diagram for 2022-069 TLE Southington - 1268 West St - Alt2
Prepared by J.R. Russo & Associates LLC, Printed 1/30/2023
HydroCAD® 10.00-26 s/n 10006 © 2020 HydroCAD Software Solutions LLC

Summary for Subcatchment 1S: EX W

Runoff = 2.11 cfs @ 12.20 hrs, Volume= 0.208 af, Depth= 1.61"

Runoff by SCS TR-20 method, UH=SCS, Weighted-CN, Time Span= 1.00-72.00 hrs, dt= 0.01 hrs
Type III 24-hr 10-year Rainfall=5.51"

Area (sf)	CN	Description
53,203	61	Pasture/grassland/range, Good, HSG B
14,478	55	Woods, Good, HSG B
67,681	60	Weighted Average
67,681		100.00% Pervious Area

Tc (min)	Length (feet)	Slope (ft/ft)	Velocity (ft/sec)	Capacity (cfs)	Description
4.4	25	0.0660	0.09		**Sheet Flow, W** Woods: Light underbrush n= 0.400 P2= 3.20"
5.8	75	0.0420	0.22		**Sheet Flow, GR** Grass: Short n= 0.150 P2= 3.20"
2.1	169	0.0361	1.33		**Shallow Concentrated Flow, GR** Short Grass Pasture Kv= 7.0 fps
1.3	75	0.0347	0.93		**Shallow Concentrated Flow, W** Woodland Kv= 5.0 fps
13.6	344	Total			

Summary for Subcatchment 2S: EX E

Runoff = 1.56 cfs @ 12.24 hrs, Volume= 0.163 af, Depth= 1.61"

Runoff by SCS TR-20 method, UH=SCS, Weighted-CN, Time Span= 1.00-72.00 hrs, dt= 0.01 hrs
Type III 24-hr 10-year Rainfall=5.51"

Area (sf)	CN	Adj	Description
35,557	61		Pasture/grassland/range, Good, HSG B
15,322	55		Woods, Good, HSG B
2,127	98		Unconnected pavement, HSG B
53,006	61	60	Weighted Average, UI Adjusted
50,879			95.99% Pervious Area
2,127			4.01% Impervious Area
2,127			100.00% Unconnected

Tc (min)	Length (feet)	Slope (ft/ft)	Velocity (ft/sec)	Capacity (cfs)	Description
5.3	31	0.0645	0.10		**Sheet Flow, W** Woods: Light underbrush n= 0.400 P2= 3.20"
7.7	69	0.0174	0.15		**Sheet Flow, GR** Grass: Short n= 0.150 P2= 3.20"
2.9	232	0.0366	1.34		**Shallow Concentrated Flow, GR** Short Grass Pasture Kv= 7.0 fps
15.9	332	Total			

Summary for Subcatchment S1: CB1

Runoff = 1.39 cfs @ 12.07 hrs, Volume= 0.097 af, Depth= 3.95"

Runoff by SCS TR-20 method, UH=SCS, Weighted-CN, Time Span= 1.00-72.00 hrs, dt= 0.01 hrs
Type III 24-hr 10-year Rainfall=5.51"

Area (sf)	CN	Description
3,643	61	>75% Grass cover, Good, HSG B
8,792	98	Unconnected pavement, HSG B
475	55	Woods, Good, HSG B
12,910	86	Weighted Average
4,118		31.90% Pervious Area
8,792		68.10% Impervious Area
8,792		100.00% Unconnected

Tc (min)	Length (feet)	Slope (ft/ft)	Velocity (ft/sec)	Capacity (cfs)	Description
5.0					**Direct Entry,**

Summary for Subcatchment S2: CB2

Runoff = 1.76 cfs @ 12.07 hrs, Volume= 0.129 af, Depth= 4.70"

Runoff by SCS TR-20 method, UH=SCS, Weighted-CN, Time Span= 1.00-72.00 hrs, dt= 0.01 hrs
Type III 24-hr 10-year Rainfall=5.51"

Area (sf)	CN	Description
1,947	61	>75% Grass cover, Good, HSG B
12,427	98	Unconnected pavement, HSG B
14,374	93	Weighted Average
1,947		13.55% Pervious Area
12,427		86.45% Impervious Area
12,427		100.00% Unconnected

Tc (min)	Length (feet)	Slope (ft/ft)	Velocity (ft/sec)	Capacity (cfs)	Description
5.0					**Direct Entry,**

Summary for Subcatchment S3: ROOF

Runoff = 1.28 cfs @ 12.07 hrs, Volume= 0.101 af, Depth> 5.27"

Runoff by SCS TR-20 method, UH=SCS, Weighted-CN, Time Span= 1.00-72.00 hrs, dt= 0.01 hrs
Type III 24-hr 10-year Rainfall=5.51"

Area (sf)	CN	Description
10,000	98	Unconnected pavement, HSG B
10,000		100.00% Impervious Area
10,000		100.00% Unconnected

Tc (min)	Length (feet)	Slope (ft/ft)	Velocity (ft/sec)	Capacity (cfs)	Description
5.0					**Direct Entry,**

Summary for Subcatchment S4: BASIN

Runoff = 0.71 cfs @ 12.08 hrs, Volume= 0.052 af, Depth= 1.69"

Runoff by SCS TR-20 method, UH=SCS, Weighted-CN, Time Span= 1.00-72.00 hrs, dt= 0.01 hrs
Type III 24-hr 10-year Rainfall=5.51"

Area (sf)	CN	Adj	Description
13,018	61		>75% Grass cover, Good, HSG B
2,432	55		Woods, Good, HSG B
709	98		Unconnected pavement, HSG B
16,159	62	61	Weighted Average, UI Adjusted
15,450			95.61% Pervious Area
709			4.39% Impervious Area
709			100.00% Unconnected

Tc (min)	Length (feet)	Slope (ft/ft)	Velocity (ft/sec)	Capacity (cfs)	Description
5.0					**Direct Entry,**

Summary for Subcatchment S5: STREET

Runoff = 0.96 cfs @ 12.08 hrs, Volume= 0.067 af, Depth= 2.08"

Runoff by SCS TR-20 method, UH=SCS, Weighted-CN, Time Span= 1.00-72.00 hrs, dt= 0.01 hrs
Type III 24-hr 10-year Rainfall=5.51"

Area (sf)	CN	Adj	Description
11,012	61		>75% Grass cover, Good, HSG B
806	55		Woods, Good, HSG B
5,064	98		Unconnected pavement, HSG B
16,882	72	66	Weighted Average, UI Adjusted
11,818			70.00% Pervious Area

JOB 2022-69
SHEET NO. 1 OF 1
CALCULATED BY CJC DATE 1-30-2023
CHECKED BY _____ DATE _____
SCALE _____

Water Quality Volume (WQV) Calculations

$WQV = (1")RA/12$
$R = 0.05 + 0.009I$

I = percent impervious coverage
R = volumetric runoff coefficient
A = contributing area

A = 53,443 s.f.
$I = \frac{31,928 \text{ s.f. impervious}}{53,443 \text{ s.f. total}} = 59.74\%$
$R = 0.05 + 0.009(59.74) = 0.588$
$WQV = (1")(0.588)(53,443)/12 = \boxed{2,617 \text{ c.f.}}$

$\text{Forebay} = 0.25(WQV) = 0.25(2617) = \boxed{654 \text{ c.f.}}$

WQV Check:

Basin storage below outlet = 5,939 c.f. > 2,617 c.f. ✓
Forebay storage = 883 c.f. > 654 c.f. ✓

S:\Acad\2022 Civil 3D\2022-069 Bailey Properties - 1268 West St\Russo Drawings\2022-069.dwg

SUBSURFACE SEWAGE DISPOSAL SYSTEM (SSDS) NOTES:

GENERAL

This system is designed for a 1,989 GPD daycare facility. The soil test results and soil types apply only to the test holes shown and may not be the same for other areas on the site. Soil type, grade and various elevations must be verified by owner or contractor over the entire leaching area during construction.

Foundation dimensions shown on this plan are for site design purposes only. The foundation contractor shall use architectural plans for layout and construction of the building(s) foundation.

Location of existing utilities shown on this plan are approximate and may not be complete, contractor must call before digging for verification 1-800-922-4455.

The SSDS installation must conform to local and state Health Department requirements. Any deviation from the SSDS design as shown hereon must be approved by the design engineer prior to construction.

LOCATION

All parts of the SSDS shall be at least 10 feet from all property lines. Leaching systems placed in fill shall be at least 15 feet from a property line. In addition, the primary leaching system shall be at least 25 feet from a downgradient property line when MLSS applies.

Non-perforated drainage pipe shall be at least 25 feet from the SSDS unless constructed of gasketed tight pipe as listed on Table 2-C of the Technical Standards of the CT Public Health Code. Tight pipe may be no less than 5 feet from the SSDS as long as the trench is not backfilled with free draining material conforming to CT DOT Form 816 M.02.07.

Potable water and/or irrigation lines which flow under pressure shall be at least 10 feet from the SSDS.

Utility service trenches (underground electric, gas, phone services, etc.) shall be at least 5 feet from the SSDS. When a utility trench is backfilled with free draining material (M.02.07), this distance shall be increased to 25 feet. All utility trenches within 25 feet of the SSDS shall be inspected by the local Health Department prior to burial.

The as-built location of the SSDS shall be measured and recorded by the installer prior to backfilling. Copies of the as-built shall be provided to the local Health Department official and the design engineer.

PIPING

Piping from the building to the septic tank shall be 4" PVC Schedule 40 or approved equal and laid at a minimum slope of 1/4" per foot. Piping leaving the septic tank to the distribution box shall be 4" PVC SDR-35 or approved equal and laid at a minimum slope of 1/8" per foot. Piping located within the leaching trenches shall be perforated 4" PVC SDR-35 or approved equal and laid level or on a grade not more than 2 to 4 inches per one hundred feet.

Cleanouts are required every 75 feet from the building to the septic tank and where a cumilative change in direction greater than 45° occurs, unless a 90° (36" radius) sweep is utilized per Table No. 2 of the Technical Standards of the CT Public Health Code.

SEPTIC TANK

Septic tank capacity shall be at least the 24-hour design flow and no less than 1,000 gallons. Garbage grinders are not recommended but if installed, add 250 gallons to required tank capacity. All septic tanks (except tanks in series) shall contain two compartments with 2/3 the required capacity in the first compartment.

Septic tanks shall include minimum 17-inch diameter access holes with removable covers directly over the inlet and outlet pipes. If a tank access hole is more than 12 inches below finished grade, provide 24-inch diameter riser with manhole frame & cover to within 12 inches of finished grade. When the cover over the tank exceeds 42 inches, the tank and risers shall be rated H-20. When the tank is located under vehicular travel areas, the tank, risers and cover assemblies shall be rated for H-20 wheel loadings.

All newly installed tanks shall have an approved non-by-pass effluent filter at the outlet. A list of approved outlet filters can be found in Appendix B of the Technical Standards of the CT Public Health Code.

LEACHING SYSTEM

The contractor is required to use care during construction to keep the leaching area undisturbed until it is staked and approved for installation by the design engineer or Health Department Official.

The bottom of the leaching system must at least 18 inches above the maximum ground water level and four feet above ledge rock. Whenever the design percolation rate is faster than one inch per minute, the minimum separation to maximum groundwater must be increased to 24 inches, and the minimum separation above ledge rock shall be increased to eight feet or distances shall be doubled from any well in accordance with Table No. 1, item A of the Technical Standards of the CT Public Health Code.

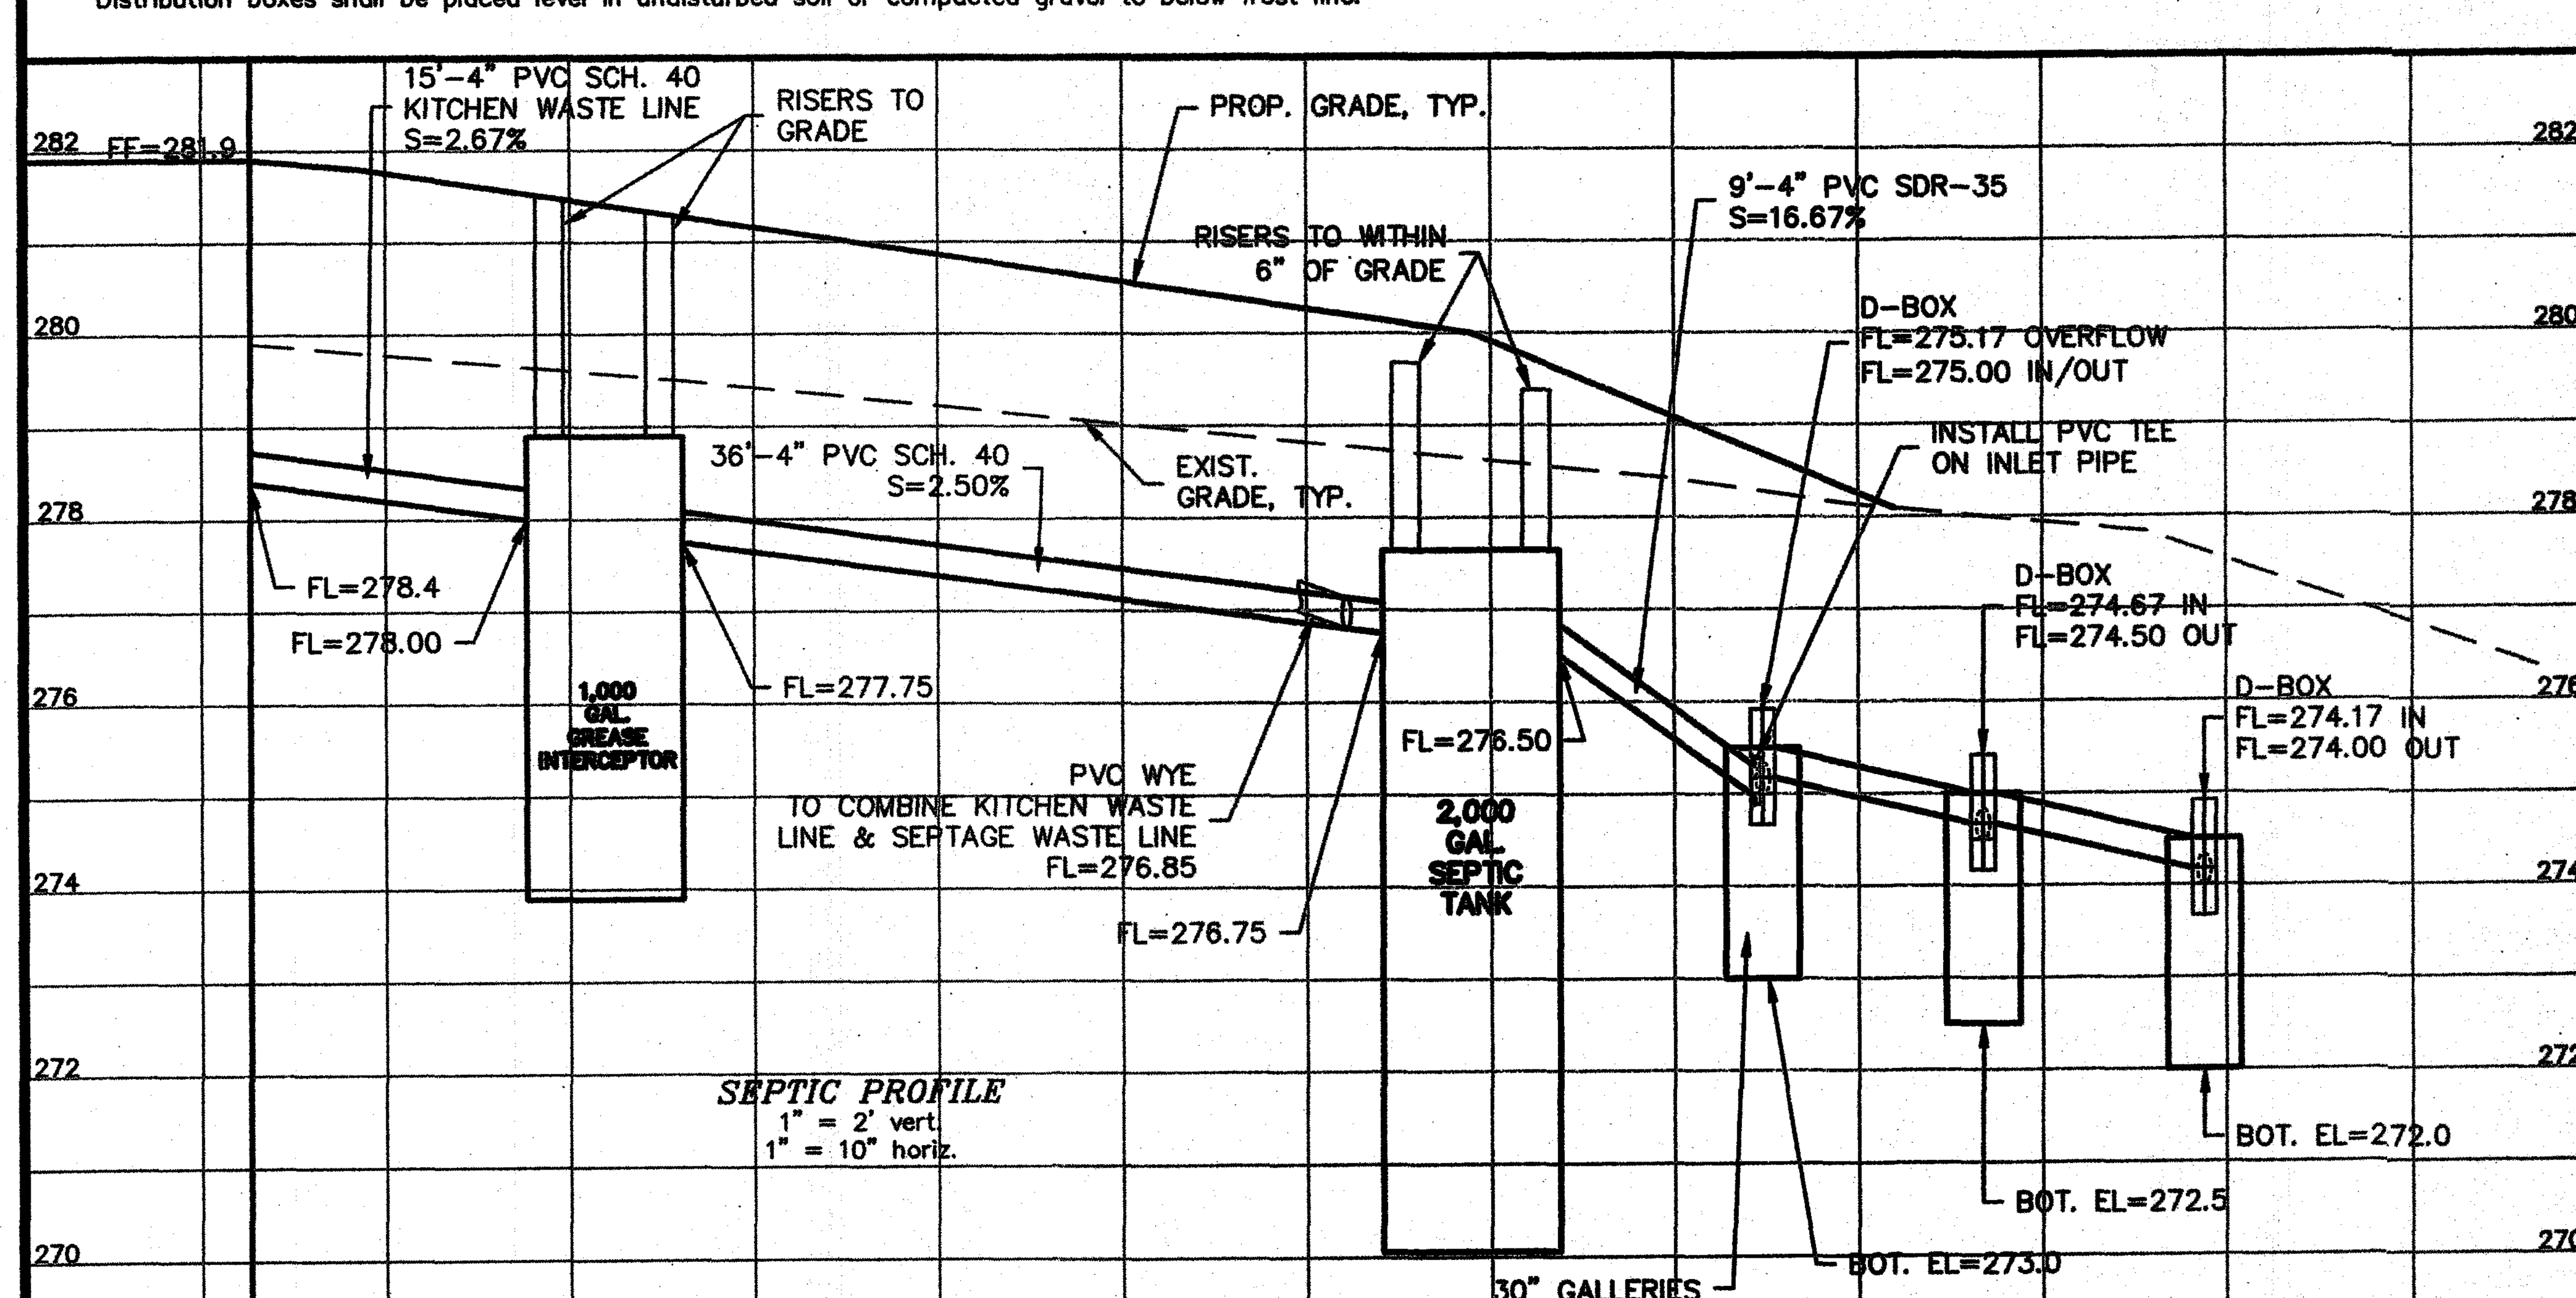
The ground surface over the entire SSDS shall be graded and maintained to lead surface water away from the area. Leaching systems shall be covered with a minimum of 6 inches of soil and seeded to prevent erosion over and adjacent to the system.

Select (septic) fill placed within and adjacent to leaching system areas shall be clean sand, or sand and gravel, free from organic matter and foreign substances. The select fill shall contain no material larger than 3", and up to 45% of the dry weight may be retained on the #4 sieve. Material passing the #4 sieve shall be reweighed to verify compliance with the following gradation:

Sieve Size	% Passing Wet Sieve	% Passing Wet Sieve (Alt.)	% Passing Dry Sieve
#4	100	100	100
#10	70 - 100	70 - 100	70 - 100
#40	10 - 50	10 - 75	10 - 75
#100	0 - 20	0 - 10	0 - 5
#200	0 - 5	0 - 5	0 - 2.5

Material that does not meet the dry sieve gradation, is still acceptable if it meets either of the wet sieve gradations above.

Distribution boxes shall be placed level in undisturbed soil or compacted gravel to below frost line.



PERMANENT SEEDING (PS)

SPECIFICATIONS

Time Of Year

Seeding dates in Connecticut are normally April 1 through June 15 and August 15 through October 1. Spring seedings give the best results and spring seedings of all mixes with legumes is recommended. There are two exceptions to the above dates. The first exception is when seedings will be made in the areas of Connecticut known as the Coastal Slope and the Connecticut River Valley. The Coastal Slope includes the coastal towns of New London, Middlesex, New Haven, and Fairfield counties. In these areas, with the exception of crown vetch (when crown vetch is seeded in late summer, at least 35% of the seed should be hard seed (unscarified), the final fall seeding dates can be extended and additional 15 days. The second exception is frost crack or dormant seeding, the seed is applied during the time of year when no germination can be expected, normally November through February. Germination will take place when weather conditions improve, mulching is extremely important to protect the seed from wind and surface erosion and to provide erosion protection until the seeding becomes established.

Site Preparation

Grade in accordance with the Land Grading measure which is in the Connecticut Guidelines For Soil Erosion and Sediment Control latest edition.

Install all necessary surface water controls.

For areas to be mowed remove all surface stones 2 inches or larger. Remove all other debris such as wire, cable tree roots, pieces of concrete, clods, lumps, or other unsuitable material.

Seed Selection

Lawn Areas: Premium Seed Mix for Sun and Shade.
Stormwater Basin: New England Erosion Control/Restoration Mix by New England Wetland Plants, Inc. or approved equal.

Seedbed Preparation

Apply topsoil, if necessary, in accordance with the Topsoiling measure which is in the Connecticut Guidelines For Soil Erosion and Sediment Control latest edition.

Apply ground limestone and fertilizer according to soil test recommendations (such as those offered by the University of Connecticut Soil Testing Laboratory or other reliable source).

Where soil testing is not feasible on small or variable sites, or where timing is critical, fertilizer may be applied at the rate of 300 pounds per acre or 7.5 pounds per 1,000 square feet of 10-10-10 or equivalent and limestone at 4 tons per acre or 200 pounds per 1,000 square feet.

Work lime and fertilizer into the soil to a depth of 3 to 4 inches with a disc or other suitable equipment.

Inspect seedbed just before seeding. If the soil is compacted, crusted or hardened, scarify the area prior to seeding.

Seed Application

Apply selected seed at rates per manufacturer's recommendations uniformly by hand, cyclone seeder, drill, cultipacker type seeder or hydroseeder (slurry including seed, fertilizer). Normal seeding depth is from 0.25 to 0.5 inch. Increase seeding rates by 10% when hydroseeding or frost crack seeding. Seed warm season grasses during the spring period only.

Mulching

See guidelines in the Mulch For Seed measures.

MAINTENANCE

Inspect temporary soil protection area at least once a week and within 24 hours of the end of a storm with a rainfall amount of 0.5 inch or greater during the first growing season.

Where seed has been moved or where soil erosion has occurred, determine the cause of the failure and repair as needed.

TEMPORARY SEEDING (TS)

SPECIFICATIONS

Site Preparation

Install needed erosion control measures such as diversions, grade stabilization structures, sedimentation basins and grassed waterways in accordance with the approved plan.

Grade according to plans and allow for the use of appropriate equipment for seedbed preparation, seeding, mulch application and mulch anchoring.

Seedbed Preparation

Loosen the soil to a depth of 3-4 inches with a slightly roughened surface. If the area has been recently loosened or disturbed, no further roughening is required. Soil preparation can be accomplished by tracking with a bulldozer, discing harrowing, raking or dragging with a section of chain link fence.

Apply ground limestone and fertilizer according to soil test recommendations (such as those offered by the University of Connecticut Soil Testing Laboratory or other reliable source).

If soil testing is not feasible on small or variable sites, or where timing is critical, fertilizer may be applied at the rate of 300 pounds per acre or 7.5 pounds per 1,000 square feet of 10-10-10 or equivalent.

Seeding

Apply seed uniformly by hand, cyclone seeder, drill, cultipacker type seeder or hydroseeder. The temporary seed shall be Rye (grain) applied at a rate of 120 pounds per acre. Increase seeding rates by 10% when hydroseeding.

Mulching

See guidelines in the Mulch For Seed measures.

MAINTENANCE

Inspect temporary seeding area at least once a week and within 24 hours of the end of a storm with a rainfall amount of 0.5 inch or greater for seed and mulch movement and rill erosion.

Where seed has been moved or where soil erosion has occurred, determine the cause of the failure and repair as needed.

MULCH FOR SEED (MS)

SPECIFICATIONS

Materials

Types of Mulches *within this specification include, but are not limited to:*

1. Hay: *The dried stems and leafy parts of plants cut and harvested, such as alfalfa, clovers, other forage legumes and the finer stemmed, leafy grasses. The average stem length should not be less than 4 inches. Hay that can be windblown should be anchored to hold it in place.*

2. Straw: *Cut and dried stems of herbaceous plants, such as wheat, barley, cereal rye, or brome. The average stem length should not be less than 4 inches. Straw that can be windblown should be anchored to hold it in place.*

3. Cellulose Fiber: *Fiber origin is either virgin wood, post-industrial/pre-consumer wood or post consumer wood complying with materials specification (collectively referred to as "wood fiber"), newspaper, kraft paper, cardboard (collectively referred to as "paper fiber") or a combination of wood and paper fiber. Paper fiber, in particular, shall not contain boron, which inhibits seed germination. The cellulose fiber must be manufactured in such a manner that after the addition to and agitation in slurry tanks with water, the fibers in the slurry become uniformly suspended to form a homogeneous product. Subsequent to hydraulic spraying on the ground, the mulch shall allow for the absorption and percolation of moisture and shall not form a tough crust such that it interferes with seed germination or growth. Generally applied with tackifier and fertilizer. Refer to manufacturer's specifications for application rates needed to attain 80%-95% coverage without interfering with seed germination or plant growth. Not recommended as a mulch for use when seeding occurs outside of the recommended seeding dates.*

Tackifiers *within this specification include, but are not limited to: Water soluble materials that cause mulch particles to adhere to one another, generally consisting of either a natural vegetable gum blended with gelling and hardening agents or a blend of hydrophilic polymers, resins, viscosifiers, sticking aids and gums. Good for areas intended to be mowed. Cellulose fiber mulch may be applied as a tackifier to other mulches, provided the application is sufficient to cause the other mulches to adhere to one another.* ***Emulsified asphalts are specifically prohibited for use as tackifiers due to their potential for causing water pollution following its application.***

Nettings *within this specification include, but are not limited to: Prefabricated openwork fabrics made of cellulose cords, ropes, threads, or biodegradable synthetic material that is woven, knotted or molded in such a manner that it holds mulch in place until vegetation growth is sufficient to stabilize the soil. Generally used in areas where no mowing is planned.*

Site Preparation

Grade according to plans and allow for the use of appropriate equipment for seedbed preparation, seeding, mulch application and mulch anchoring.

Application

Timing: *Applied immediately following seeding. Some cellulose fiber may be applied with seed to assist in marking where seed has been sprayed, but expect to apply a second application of cellulose fiber to meet the requirements of* ***Mulch For Seed*** *in the Connecticut Guidelines For Soil Erosion and Sediment Control latest edition.*

Spreading: *Mulch material shall be spread uniformly by hand or machine resulting in 80%-95% coverage of the disturbed soil when seeding within the recommended seeding dates. Applications that are uneven can result in excessive mulch smothering the germinating seeds. For hay or straw anticipate an application rate of 2 tons per acre. For cellulose fiber follow manufacture's recommended application rates to provided 80%-95% coverage.*

When seeding outside the recommended seeding dates, increase mulch application rate to provide between 95%-100% coverage of the disturbed soil. For hay or straw anticipate an application rate to 2.5 to 3 tons per acre.

When spreading hay mulch by hand, divide the area to be mulched into approximately 1,000 square feet and place 1.5-2 bales of hay in each section to facilitate uniform distribution.

For cellulose fiber mulch, expect several spray passes to attain adequate coverage, to eliminate shadowing, and to avoid slippage.

Anchoring: *Expect the need for mulch anchoring along the shoulders of actively traveled roads, hill tops and long open slopes not protected by wind breaks.*

When using netting, the most critical aspect is to ensure that the netting maintains substantial contact with the underlying mulch and the mulch, in turn, maintains continuos contact with the soil surface. Without such contact, the material is useless and erosion can be expected to occur.

MAINTENANCE

Inspect mulch for seed area at least once a week and within 24 hours of the end of a storm with a rainfall amount of 0.5 inch or greater until the grass has germinated to determine maintenance needs.

Where mulch has been moved or where soil erosion has occurred, determine the cause of the failure and repair as needed.

SOIL ERSOION & SEDIMENT CONTROL NOTES

1. *The contractor/developer shall notify the Town Staff prior to construction in accordance with the local approvals and permits.*
2. *All soil erosion and sediment control work shall be done in strict accordance with the Connecticut Guidelines For Soil Erosion and Sediment Control latest edition.*
3. *Any additional erosion/sediment control deemed necessary by the engineer during construction, shall be installed by the developer. In addition, the developer shall be responsible for the repair/replacement and/or maintenance of all erosion control measures until all disturbed areas are stabilized to the satisfaction of the town staff.*
4. *All soil erosion and sediment control operations shall be in place prior to any grading operations and installation of proposed structures or utilities and shall be left in place until construction is completed and/or area is stabilized.*
5. *In all areas, removal of trees, bushes and other vegetation as well as disturbance of the soil is to be kept to an absolute minimum while allowing proper development of the site. During construction, expose as small an area of soil as possible for as short a time as possible.*
6. *The developer shall practice effective dust control per the soil conservation service handbook during construction and until all areas are stabilized or surface treated. The developer shall be responsible for the cleaning of nearby streets of any debris from these construction activities.*
7. *All fill areas shall be compacted sufficiently for their intended purpose and as required to reduce slipping, erosion or excess saturation. Fill intended to support buildings, structures, conduits, etc., shall be compacted in accordance with local requirements or codes.*
8. *Topsoil is to be stripped and stockpiled in amounts necessary to complete finished grading of all exposed areas requiring topsoil. The stockpiled topsoil is to be located as designated on the plans. Topsoil shall not be placed while in a frozen or muddy condition, when the subgrade is excessively wet, or in a condition that may otherwise be detrimental to proper grading or proposed sodding or seeding.*
9. *Any and all fill material is to be free of brush, rubbish, timber, logs vegetative matter and stumps in amounts that will be detrimental to constructing stable fills. Maximum side slopes of exposed surfaces of earth to be 3:1 or as otherwise specified by local authorities.*
10. *Soil stabilization should be completed within 5 days of clearing or inactivity in construction.*
11. *Waste Materials - All waste materials (including wastewater) shall be disposed of in accordance with local, state and federal law. Litter shall be picked up at the end of each work day.*
12. *The Contractor shall maintain on-site additional erosion control materials as a contingency in the event of a failure or when required to shore up existing BMPs. At a minimum, the on-site contingency materials should include 30 feet of silt fence and 5 straw haybales with 10 stakes.*

CHECKLIST FOR EROSION CONTROL PLAN

PROJECT: The Learning Experience Academy of Education

LOCATION: 1268 West Street, Southington, CT

PROJECT DESCRIPTION: Construction of a Daycare Facility

Date of final stabilization: ____

PROJECT NARRATIVE AND CONSTRUCTION SEQUENCE

This project is located at 1268 West Street in Southington, Connecticut. The proposed activity is the construction of a 10,000 square foot daycare facility. The suggested schedule of construction is as follows:

1. Install construction anti-tracking pad (CE).
2. Install sediment barriers (GSF) at project perimeters.
3. Demolish existing building and items called to be removed in accordance with local/state/federal regulations. Coordinate utility disconnections with appropriate utility companies.
4. Strip topsoil. Stockpile suitable amount of topsoil for reuse on-site in areas shown. Stockpiles shall be surrounded by sediment barriers (GSF).
5. Begin building construction.
6. Construct stormwater management basin and install drainage. Hydroseed basin with a tackifier as soon as practicable.
7. Install other site utilities.
8. Install parking lot and driveway base.
9. Install concrete sidewalks and dumpster pad.
10. Pave binder course.
11. Stabilize remaining areas to receive topsoil and permanently seed as soon as possible.
12. Install landscaping.
13. Install pavement top course in all areas. Sweep binder course and apply tack coat prior to placing pavement top course.
14. Apply paint striping.
15. Remove sediment barriers after site is fully stabilized.

Construction of this site is anticipated to begin in the spring of 2023 and be complete by January 2024, pending approvals. Temporary erosion control measures shall be installed prior to any soil disturbance and maintained throughout construction until soils have been stabilized with permanent vegetation.

The Contractor shall keep the area of disturbance to a minimum and establish vegetative cover on exposed soils as soon as practical. All soil and erosion control measures shall be installed and maintained in accordance with these plans and the "Connecticut DEP Guidelines for Soil Erosion and Sediment Control", as amended. The Contractor shall verify all conditions noted on the plans and shall immediately notify the Engineer of any discrepancies.

The developer shall be responsible for the repair/replacement/maintenance of all erosion control measures until all disturbed areas are stabilized. Accumulated sediment shall be removed as required to keep silt fence functional. In all cases, deposits shall be removed when the accumulated sediment has reached one-half above the ground height of the silt fence. This material is to be spread and stabilized in areas not subject to erosion, or to be used in areas which are not to be paved or built on. Silt fence (GSF) is to be replaced as necessary to maintain proper filtering action. Silt fence (GSF) are to remain in place and shall be maintained to insure efficient sediment capture until all areas above the erosion checks are stabilized and vegetation has been established.

POST CONSTRUCTION MAINTENANCE NOTES:

The property owner shall be responsible for performing the following post construction maintenance schedule:

1. Maintain lawn & landscape areas with minimal pesticides.
2. Sweep parking lot and paved areas at least once per year in the spring.
3. Inspect catch basins at least twice per year, including after sweeping. Clean at least once per year in April and as necessary to prevent the discharge of pollutants from structures. Remove accumulated oil, trash and excessive sediment with vac-truck. Check condition of hoods (if applicable).
4. Inspect infiltration basin annually for evidence of hydrocarbons and remove by vac-truck. Repair eroded areas and replace riprap and vegetation as required. Dredge bottom of forebay to remove accumulated sediment every 10 years or when significant volume reduction is observed. Mow infiltration basin on a regular basis to maintain as lawn area for filtering of pollutants. Inspect inlet pipes outlet structure monthly and remove trash and debris as needed.

PLANNING AND ZONING DEPARTMENT

JOHN WEICHSEL MUNICIPAL CENTER – 196 NORTH MAIN STREET
SOUTHINGTON, CONNECTICUT 06489

Phone: (860)276-6248

March 9, 2023

Southington West Street LLC
56 East Main St
Avon, CT 06001

RE: 1268 West St (SPR #1857.1)

Dear Mr. Spungin:

Please be advised that on March 7, 2023 the Southington Planning and Zoning Commission voted to approve the above referenced site plan application to construct a 10,000 sq. ft daycare facility in an R-40 at the property located at 1268 West St.

Please submit five (5) paper sets of revised plans for signature. Once plans are signed, the Town will set any bonds required, which must be posted prior to the start of any work. Building and zoning permits and a preconstruction meeting will also be required. Please note that this approval is good for a period of five (5) years, which will expire on March 7, 2028.You can request a five-year extension prior to the expiration date if the work has not been completed.

Respectfully,

David Layallee
Acting Director of Planning and Community Development

S:\Acad\2022 Civil 3D\2022-069 Bailey Properties - 1268 West St\Russo Drawings\2022-069.dwg

SUBSURFACE SEWAGE DISPOSAL SYSTEM (SSDS) NOTES:

GENERAL

This system is designed for a 1,989 GPD daycare facility. The soil test results and soil types apply only to the test holes shown and may not be the same for other areas on the site. Soil type, grade and various elevations must be verified by owner or contractor over the entire leaching area during construction.

Foundation dimensions shown on this plan are for site design purposes only. The foundation contractor shall use architectural plans for layout and construction of the building(s) foundation.

Location of existing utilities shown on this plan are approximate and may not be complete, contractor must call before digging for verification 1–800–922–4455.

The SSDS installation must conform to local and state Health Department requirements. Any deviation from the SSDS design as shown hereon must be approved by the design engineer prior to construction.

LOCATION

All parts of the SSDS shall be at least 10 feet from all property lines. Leaching systems placed in fill shall be at least 15 feet from a property line. In addition, the primary leaching system shall be at least 25 feet from a downgradient property line when MLSS applies.

Non–perforated drainage pipe shall be at least 25 feet from the SSDS unless constructed of gasketed tight pipe as listed on Table 2–C of the Technical Standards of the CT Public Health Code. Tight pipe may be no less than 5 feet from the SSDS as long as the trench is not backfilled with free draining material conforming to CT DOT Form 816 M.02.07.

Potable water and/or irrigation lines which flow under pressure shall be at least 10 feet from the SSDS.

Utility service trenches (underground electric, gas, phone services, etc.) shall be at least 5 feet from the SSDS. When a utility trench is backfilled with free draining material (M.02.07), this distance shall be increased to 25 feet. All utility trenches within 25 feet of the SSDS shall be inspected by the local Health Department prior to burial.

The as–built location of the SSDS shall be measured and recorded by the installer prior to backfilling. Copies of the as–built shall be provided to the local Health Department official and the design engineer.

PIPING

Piping from the building to the septic tank shall be 4" PVC Schedule 40 or approved equal and laid at a minimum slope of 1/4" per foot. Piping leaving the septic tank to the distribution box shall be 4" PVC SDR–35 or approved equal and laid at a minimum slope of 1/8" per foot. Piping located within the leaching trenches shall be perforated 4" PVC SDR–35 or approved equal and laid level or on a grade not more than 2 to 4 inches per one hundred feet.

Cleanouts are required every 75 feet from the building to the septic tank and where a cumilative change in direction greater than 45° occurs, unless a 90° (36" radius) sweep is utilized per Table No. 2 of the Technical Standards of the CT Public Health Code.

SEPTIC TANK

Septic tank capacity shall be at least the 24–hour design flow and no less than 1,000 gallons. Garbage grinders are not recommended but if installed, add 250 gallons to required tank capacity. All septic tanks (except tanks in series) shall contain two compartments with 2/3 the required capacity in the first compartment.

Septic tanks shall include minimum 17–inch diameter access holes with removable covers directly over the inlet and outlet pipes. If a tank access hole is more than 12 inches below finished grade, provide 24–inch diameter riser with manhole frame & cover to within 12 inches of finished grade. When the cover over the tank exceeds 42 inches, the tank and risers shall be rated H–20. When the tank is located under vehicular travel areas, the tank, risers and cover assemblies shall be rated for H–20 wheel loadings.

All newly installed tanks shall have an approved non–by–pass effluent filter at the outlet. A list of approved outlet filters can be found in Appendix B of the Technical Standards of the CT Public Health Code.

LEACHING SYSTEM

The contractor is required to use care during construction to keep the leaching area undisturbed until it is staked and approved for installation by the design engineer or Health Department Official.

The bottom of the leaching system must at least 18 inches above the maximum ground water level and four feet above ledge rock. Whenever the design percolation rate is faster than one inch per minute, the minimum separation to maximum groundwater must be increased to 24 inches, and the minimum separation above ledge rock shall be increased to eight feet or distances shall be doubled from any well in accordance with Table No. 1, item A of the Technical Standards of the CT Public Health Code.

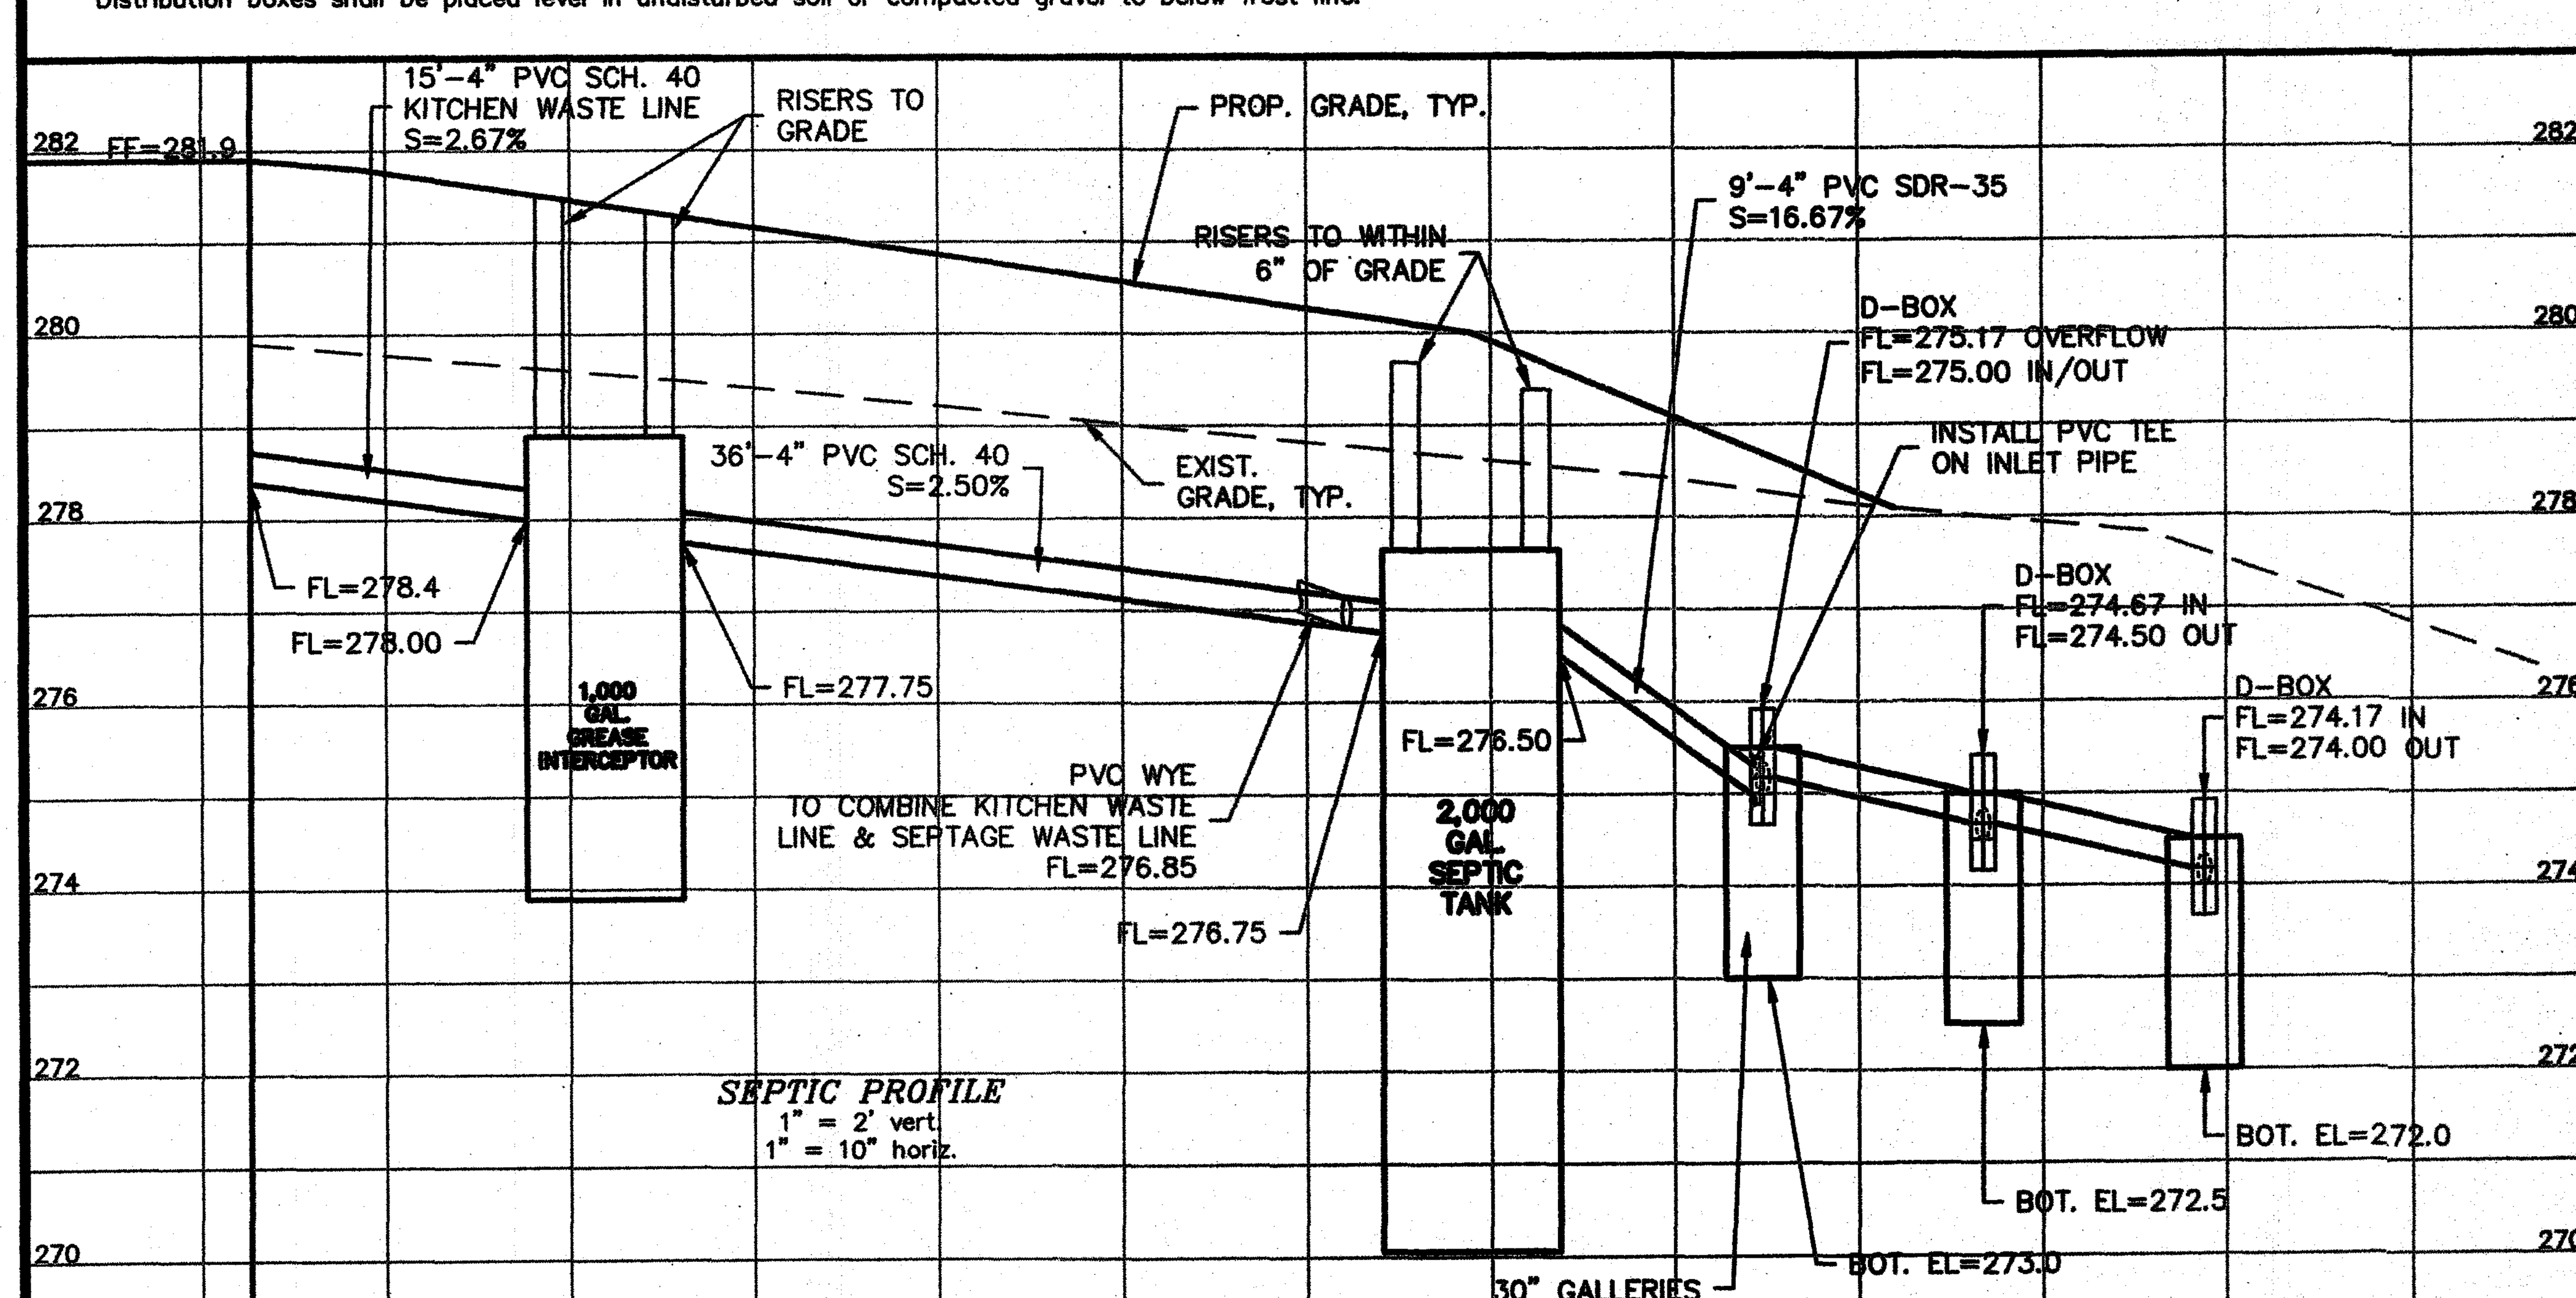
The ground surface over the entire SSDS shall be graded and maintained to lead surface water away from the area. Leaching systems shall be covered with a minimum of 6 inches of soil and seeded to prevent erosion over and adjacent to the system.

Select (septic) fill placed within and adjacent to leaching system areas shall be clean sand, or sand and gravel, free from organic matter and foreign substances. The select fill shall contain no material larger than 3", and up to 45% of the dry weight may be retained on the #4 sieve. Material passing the #4 sieve shall be reweighed to verify compliance with the following gradation:

Sieve Size	% Passing Wet Sieve	% Passing Wet Sieve (Alt.)	% Passing Dry Sieve
#4	100	100	100
#10	70 – 100	70 – 100	70 – 100
#40	10 – 50	10 – 75	10 – 75
#100	0 – 20	0 – 10	0 – 5
#200	0 – 5	0 – 5	0 – 2.5

Material that does not meet the dry sieve gradation, is still acceptable if it meets either of the wet sieve gradations above.

Distribution boxes shall be placed level in undisturbed soil or compacted gravel to below frost line.



PERMANENT SEEDING (PS)

SPECIFICATIONS

Time Of Year
Seeding dates in Connecticut are normally April 1 through June 15 and August 15 through October 1. Spring seedings give the best results and spring seedings of all mixes with legumes is recommended. There are two exceptions to the above dates. The first exception is when seedings will be made in the areas of Connecticut known as the Coastal Slope and the Connecticut River Valley. The Coastal Slope includes the coastal towns of New London, Middlesex, New Haven, and Fairfield counties. In these areas, with the exception of crown vetch (when crown vetch is seeded in late summer, at least 35% of the seed should be hard seed (unscarified), the final fall seeding dates can be extended and additional 15 days. The second exception is frost crack or dormant seeding, the seed is applied during the time of year when no germination can be expected, normally November through February. Germination will take place when weather conditions improve, mulching is extremely important to protect the seed from wind and surface erosion and to provide erosion protection until the seeding becomes established.

Site Preparation
Grade in accordance with the Land Grading measure which is in the Connecticut Guidelines For Soil Erosion and Sediment Control latest edition.

Install all necessary surface water controls.

For areas to be mowed remove all surface stones 2 inches or larger. Remove all other debris such as wire, cable tree roots, pieces of concrete, clods, lumps, or other unsuitable material.

Seed Selection
Lawn Areas: Premium Seed Mix for Sun and Shade.
Stormwater Basin: New England Erosion Control/Restoration Mix by New England Wetland Plants, Inc. or approved equal.

Seedbed Preparation
Apply topsoil, if necessary, in accordance with the Topsoiling measure which is in the Connecticut Guidelines For Soil Erosion and Sediment Control latest edition.

Apply ground limestone and fertilizer according to soil test recommendations (such as those offered by the University of Connecticut Soil Testing Laboratory or other reliable source).

Where soil testing is not feasible on small or variable sites, or where timing is critical, fertilizer may be applied at the rate of 300 pounds per acre or 7.5 pounds per 1,000 square feet of 10–10–10 or equivalent and limestone at 4 tons per acre or 200 pounds per 1,000 square feet.

Work lime and fertilizer into the soil to a depth of 3 to 4 inches with a disc or other suitable equipment.

Inspect seedbed just before seeding. If the soil is compacted, crusted or hardened, scarify the area prior to seeding.

Seed Application
Apply selected seed at rates per manufacturer's recommendations uniformly by hand, cyclone seeder, drill, cultipacker type seeder or hydroseeder (slurry including seed, fertilizer). Normal seeding depth is from 0.25 to 0.5 inch. Increase seeding rates by 10% when hydroseeding or frost crack seeding. Seed warm season grasses during the spring period only.

Mulching
See guidelines in the Mulch For Seed measures.

MAINTENANCE

Inspect temporary soil protection area at least once a week and within 24 hours of the end of a storm with a rainfall amount of 0.5 inch or greater during the first growing season.

Where seed has been moved or where soil erosion has occurred, determine the cause of the failure and repair as needed.

TEMPORARY SEEDING (TS)

SPECIFICATIONS

Site Preparation
Install needed erosion control measures such as diversions, grade stabilization structures, sedimentation basins and grassed waterways in accordance with the approved plan.

Grade according to plans and allow for the use of appropriate equipment for seedbed preparation, seeding, mulch application and mulch anchoring.

Seedbed Preparation
Loosen the soil to a depth of 3–4 inches with a slightly roughened surface. If the area has been recently loosened or disturbed, no further roughening is required. Soil preparation can be accomplished by tracking with a bulldozer, discing harrowing, raking or dragging with a section of chain link fence.

Apply ground limestone and fertilizer according to soil test recommendations (such as those offered by the University of Connecticut Soil Testing Laboratory or other reliable source).

If soil testing is not feasible on small or variable sites, or where timing is critical, fertilizer may be applied at the rate of 300 pounds per acre or 7.5 pounds per 1,000 square feet of 10–10–10 or equivalent.

Seeding
Apply seed uniformly by hand, cyclone seeder, drill, cultipacker type seeder or hydroseeder. The temporary seed shall be Rye (grain) applied at a rate of 120 pounds per acre. Increase seeding rates by 10% when hydroseeding.

Mulching
See guidelines in the Mulch For Seed measures.

MAINTENANCE

Inspect temporary seeding area at least once a week and within 24 hours of the end of a storm with a rainfall amount of 0.5 inch or greater for seed and mulch movement and rill erosion.

Where seed has been moved or where soil erosion has occurred, determine the cause of the failure and repair as needed.

MULCH FOR SEED (MS)

SPECIFICATIONS

Materials
***Types of Mulches** within this specification include, but are not limited to:*

__1. Hay:__ The dried stems and leafy parts of plants cut and harvested, such as alfalfa, clovers, other forage legumes and the finer stemmed, leafy grasses. The average stem length should not be less than 4 inches. Hay that can be windblown should be anchored to hold it in place.

__2. Straw:__ Cut and dried stems of herbaceous plants, such as wheat, barley, cereal rye, or brome. The average stem length should not be less than 4 inches. Straw that can be windblown should be anchored to hold it in place.

__3. Cellulose Fiber:__ Fiber origin is either virgin wood, post–industrial/pre–consumer wood or post consumer wood complying with materials specification (collectively referred to as "wood fiber"), newspaper, kraft paper, cardboard (collectively referred to as "paper fiber") or a combination of wood and paper fiber. Paper fiber, in particular, shall not contain boron, which inhibits seed germination. The cellulose fiber must be manufactured in such a manner that after the addition to and agitation in slurry tanks with water, the fibers in the slurry become uniformly suspended to form a homogeneous product. Subsequent to hydraulic spraying on the ground, the mulch shall allow for the absorption and percolation of moisture and shall not form a tough crust such that it interferes with seed germination or growth. Generally applied with tackifier and fertilizer. Refer to manufacturer's specifications for application rates needed to attain 80%–95% coverage without interfering with seed germination or plant growth. Not recommended as a mulch for use when seeding occurs outside of the recommended seeding dates.

Tackifiers** within this specification include, but are not limited to: Water soluble materials that cause mulch particles to adhere to one another, generally consisting of either a natural vegetable gum blended with gelling and hardening agents or a blend of hydrophilic polymers, resins, viscosifiers, sticking aids and gums. Good for areas intended to be mowed. Cellulose fiber mulch may be applied as a tackifier to other mulches, provided the application is sufficient to cause the other mulches to adhere to one another.* ***Emulsified asphalts are specifically prohibited for use as tackifiers due to their potential for causing water pollution following its application.

***Nettings** within this specification include, but are not limited to: Prefabricated openwork fabrics made of cellulose cords, ropes, threads, or biodegradable synthetic material that is woven, knotted or molded in such a manner that it holds mulch in place until vegetation growth is sufficient to stabilize the soil. Generally used in areas where no mowing is planned.*

Site Preparation
Grade according to plans and allow for the use of appropriate equipment for seedbed preparation, seeding, mulch application and mulch anchoring.

Application
***Timing:** Applied immediately following seeding. Some cellulose fiber may be applied with seed to assist in marking where seed has been sprayed, but expect to apply a second application of cellulose fiber to meet the requirements of **Mulch For Seed** in the Connecticut Guidelines For Soil Erosion and Sediment Control latest edition.*

***Spreading:** Mulch material shall be spread uniformly by hand or machine resulting in 80%–95% coverage of the disturbed soil when seeding within the recommended seeding dates. Applications that are uneven can result in excessive mulch smothering the germinating seeds. For hay or straw anticipate an application rate of 2 tons per acre. For cellulose fiber follow manufacture's recommended application rates to provided 80%–95% coverage.*

When seeding outside the recommended seeding dates, increase mulch application rate to provide between 95%–100% coverage of the disturbed soil. For hay or straw anticipate an application rate to 2.5 to 3 tons per acre.

When spreading hay mulch by hand, divide the area to be mulched into approximately 1,000 square feet and place 1.5–2 bales of hay in each section to facilitate uniform distribution.

For cellulose fiber mulch, expect several spray passes to attain adequate coverage, to eliminate shadowing, and to avoid slippage.

***Anchoring:** Expect the need for mulch anchoring along the shoulders of actively traveled roads, hill tops and long open slopes not protected by wind breaks.*

When using netting, the most critical aspect is to ensure that the netting maintains substantial contact with the underlying mulch and the mulch, in turn, maintains continuos contact with the soil surface. Without such contact, the material is useless and erosion can be expected to occur.

MAINTENANCE

Inspect mulch for seed area at least once a week and within 24 hours of the end of a storm with a rainfall amount of 0.5 inch or greater until the grass has germinated to determine maintenance needs.

Where mulch has been moved or where soil erosion has occurred, determine the cause of the failure and repair as needed.

SOIL ERSOION & SEDIMENT CONTROL NOTES

1. *The contractor/developer shall notify the Town Staff prior to construction in accordance with the local approvals and permits.*
2. *All soil erosion and sediment control work shall be done in strict accordance with the Connecticut Guidelines For Soil Erosion and Sediment Control latest edition.*
3. *Any additional erosion/sediment control deemed necessary by the engineer during construction, shall be installed by the developer. In addition, the developer shall be responsible for the repair/replacement and/or maintenance of all erosion control measures until all disturbed areas are stabilized to the satisfaction of the town staff.*
4. *All soil erosion and sediment control operations shall be in place prior to any grading operations and installation of proposed structures or utilities and shall be left in place until construction is completed and/or area is stabilized.*
5. *In all areas, removal of trees, bushes and other vegetation as well as disturbance of the soil is to be kept to an absolute minimum while allowing proper development of the site. During construction, expose as small an area of soil as possible for as short a time as possible.*
6. *The developer shall practice effective dust control per the soil conservation service handbook during construction and until all areas are stabilized or surface treated. The developer shall be responsible for the cleaning of nearby streets of any debris from these construction activities.*
7. *All fill areas shall be compacted sufficiently for their intended purpose and as required to reduce slipping, erosion or excess saturation. Fill intended to support buildings, structures, conduits, etc., shall be compacted in accordance with local requirements or codes.*
8. *Topsoil is to be stripped and stockpiled in amounts necessary to complete finished grading of all exposed areas requiring topsoil. The stockpiled topsoil is to be located as designated on the plans. Topsoil shall not be placed while in a frozen or muddy condition, when the subgrade is excessively wet, or in a condition that may otherwise be detrimental to proper grading or proposed sodding or seeding.*
9. *Any and all fill material is to be free of brush, rubbish, timber, logs vegetative matter and stumps in amounts that will be detrimental to constructing stable fills. Maximum side slopes of exposed surfaces of earth to be 3:1 or as otherwise specified by local authorities.*
10. *Soil stabilization should be completed within 5 days of clearing or inactivity in construction.*
11. *Waste Materials – All waste materials (including wastewater) shall be disposed of in accordance with local, state and federal law. Litter shall be picked up at the end of each work day.*
12. *The Contractor shall maintain on–site additional erosion control materials as a contingency in the event of a failure or when required to shore up existing BMPs. At a minimum, the on–site contingency materials should include 30 feet of silt fence and 5 straw haybales with 10 stakes.*

CHECKLIST FOR EROSION CONTROL PLAN

PROJECT: The Learning Experience Academy of Education

LOCATION: 1268 West Street, Southington, CT

PROJECT DESCRIPTION: Construction of a Daycare Facility

PARCEL AREA: 2.7 acres

RESPONSIBLE PERSONNEL: Eric Spungin (860) 989–9494

EROSION AND SEDIMENT CONTROL PLAN PREPARER: J.R. Russo & Associates, LLC

CHECKLIST:

Work Description Erosion & Sediment Control Measures	Location	Date Installed	Initials	Date Removed	Initials
Install construction entrance	As shown on plan.				
Install perimeter sediment barriers	As shown on plan.				
Install inlet protection at CBs	As installed				

MAINTENANCE OF MEASURES:

Location	Description or Number	Date	Initials

Project Dates: ____________________

Date of groundbreaking for project: ____________________

Date of final stabilization: ____________________

PROJECT NARRATIVE AND CONSTRUCTION SEQUENCE

This project is located at 1268 West Street in Southington, Connecticut. The proposed activity is the construction of a 10,000 square foot daycare facility. The suggested schedule of construction is as follows:

1. Install construction anti–tracking pad (CE).
2. Install sediment barriers (GSF) at project perimeters.
3. Demolish existing building and items called to be removed in accordance with local/state/federal regulations. Coordinate utility disconnections with appropriate utility companies.
4. Strip topsoil. Stockpile suitable amount of topsoil for reuse on–site in areas shown. Stockpiles shall be surrounded by sediment barriers (GSF).
5. Begin building construction.
6. Construct stormwater management basin and install drainage. Hydroseed basin with a tackifier as soon as practicable.
7. Install other site utilities.
8. Install parking lot and driveway base.
9. Install concrete sidewalks and dumpster pad.
10. Pave binder course.
11. Stabilize remaining areas to receive topsoil and permanently seed as soon as possible.
12. Install landscaping.
13. Install pavement top course in all areas. Sweep binder course and apply tack coat prior to placing pavement top course.
14. Apply paint striping.
15. Remove sediment barriers after site is fully stabilized.

Construction of this site is anticipated to begin in the spring of 2023 and be complete by January 2024, pending approvals. Temporary erosion control measures shall be installed prior to any soil disturbance and maintained throughout construction until soils have been stabilized with permanent vegetation.

The Contractor shall keep the area of disturbance to a minimum and establish vegetative cover on exposed soils as soon as practical. All soil and erosion control measures shall be installed and maintained in accordance with these plans and the "Connecticut DEP Guidelines for Soil Erosion and Sediment Control", as amended. The Contractor shall verify all conditions noted on the plans and shall immediately notify the Engineer of any discrepancies.

The developer shall be responsible for the repair/replacement/maintenance of all erosion control measures until all disturbed areas are stabilized. Accumulated sediment shall be removed as required to keep silt fence functional. In all cases, deposits shall be removed when the accumulated sediment has reached one–half above the ground height of the silt fence. This material is to be spread and stabilized in areas not subject to erosion, or to be used in areas which are not to be paved or built on. Silt fence (GSF) is to be replaced as necessary to maintain proper filtering action. Silt fence (GSF) are to remain in place and shall be maintained to insure efficient sediment capture until all areas above the erosion checks are stabilized and vegetation has been established.

POST CONSTRUCTION MAINTENANCE NOTES:

The property owner shall be responsible for performing the following post construction maintenance schedule:

1. Maintain lawn & landscape areas with minimal pesticides.
2. Sweep parking lot and paved areas at least once per year in the spring.
3. Inspect catch basins at least twice per year, including after sweeping. Clean at least once per year in April and as necessary to prevent the discharge of pollutants from structures. Remove accumulated oil, trash and excessive sediment with vac–truck. Check condition of hoods (if applicable).
4. Inspect infiltration basin annually for evidence of hydrocarbons and remove by vac–truck. Repair eroded areas and replace riprap and vegetation as required. Dredge bottom of forebay to remove accumulated sediment every 10 years or when significant volume reduction is observed. Mow infiltration basin on a regular basis to maintain as lawn area for filtering of pollutants. Inspect inlet pipes outlet structure monthly and remove trash and debris as needed.

RE: Special Permit Approval – 1268 West Street (SPU #652)

Dear Sir:

On September 7, 2021, the Planning and Zoning Commission voted to approve your Special Permit Application to establish an Open Space Preservation subdivision, on property located at 1268 West Street.

The special permit use becomes effective upon the filing of the approved special permit use plan with the Town Planner's office and the filing **of this original approval letter in the office of the Town Clerk**, pursuant to Section 8-3d of the General Statutes of Connecticut. Such plan shall be certified by the Planning and Zoning Commission prior to filing. An approved special permit use not put into effect within one year becomes null and void. A single one-year extension may be granted before the approval's first anniversary date (Section 8-03.3).

Respectfully,

Maryellen Edwards

RE: Special Permit Approval – 1268 West St (SPU #669.1)
(Owner: Lovley Development, Inc)

Dear Mr. Spungin:

On March 7, 2023 the Planning and Zoning Commission voted to approve your Special Permit Application for child daycare services at the property located at 1268 West St with the following stipulations:

- Provide safety fencing/gate around retention basin
- Satisfy final water comments

The special permit use becomes effective upon the filing of this original approval letter in the office of the Town Clerk, pursuant to Section 8-3d of the General Statutes of Connecticut. An approved special permit use not put into effect within one year becomes null and void. A single one-year extension may be granted before the approval's first anniversary date (Section 8-03.3).

Respectfully,

David Lavallee

Re: **1268 West St**

Zoning Permit #: **18753**

Dear Mr. DeCarli:

Please be advised that the above-referenced property has met the code requirements enforced by the Health District for the following:

☒ A subsurface sewage disposal system.

☐ A private water supply well.

☒ Other item as follows: This does NOT complete the Health District requirements and does not authorize or grant final approval for the operation of a childcare facility or offer food service preparations within. Septic system completion only.

If you have any questions, please contact my office.

The punchlist is as follows:

- Remove site dumpster.
- Reseed back yard area.
- The height of all signs shall be per the MUTCD manual – all signs are below 7-feet clearance.
- New sidewalk will be re-inspected for cracks. If the walk is good, the PI bond will be released.
- Re-check the pond and the last basin (hood) when it is a drier day.

RE: 1268 West St (SPR #1857.1)

Dear Mr. Spungin:

Please be advised that on March 7, 2023 the Southington Planning and Zoning Commission voted to approve the above referenced site plan application to construct a 10,000 sq. ft daycare facility in an R-40 at the property located at 1268 West St.

Please submit five (5) paper sets of revised plans for signature. Once plans are signed, the Town will set any bonds required, which must be posted prior to the start of any work. Building and zoning permits and a preconstruction meeting will also be required. Please note that this approval is good for a period of five (5) years, which will expire on March 7, 2028. You can request a five-year extension prior to the expiration date if the work has not been completed.

Respectfully,

David Layallee

Re: The proposed 6" DICL Fire Service and 2" Domestic Service located at 1268 West Street in Southington, CT.

To Whom It May Concern;

This letter is to inform you that proposed fire protection service and water service for the above referenced project were approved by the Southington Board of Water Commissioners at their March 9th meeting. Your project may proceed without any further delay from our department.

Please contact the water department at your earliest convenience for payment of fees related to the tap and inspection of the water main as well as project scheduling.

If you have any questions, please feel free to contact me at the Southington Water Department. My number here is (860) 628-5593.

Sincerely,

Elijah Stewart

Re: 1268 West St, Southington, CT, 06489- Review for Plot Plan Approval

Plainville-Southington Regional Health District conducted soil testing on the above referenced property and reviewed a site plan prepared by JR Russo, dated February 6, 2023. The proposed The Learning Experience childcare center will be supplied by public water and a private septic system. Approval has been granted with the following comments:

- Confirmatory test pits must be conducted prior to or at the time of foundation excavation. The depth of the test pits must be such to confirm 4 feet of clearance between the septic system and bottom of test pit. Should conditions not be consistent with previous testing, a revision must be submitted and approved prior to continuing with construction.
- A Food Service Plan Review for a Class 4 establishment must be conducted and approved prior to interior construction.
- Secondary safety devices must be installed on the septic tank and grease interceptor tank in compliance with CT Technical Standards 2023.
- Any existing septic systems found on the property must be property pumped, crushed, and documented in accordance with the Plainville-Southington Regional Health District.
- Any wells found on the property must be property abandoned by a licensed well drilled. Property documentation must be submitted to this department.

If you have any further questions, please call (860)276-6275 or email me at burdackij@southington.org.

   INFO@JRRUSSO.COM

2. THE G.C. SHALL BE SOLELY RESPONSIBLE FOR AND HAVE CONTROL OVER CONSTRUCTION MEANS, METHODS, TECHNIQUES, PROCEDURES, COMPLIANCE WITH APPLICABLE ORDINANCES AND JURISDICTIONAL JOB SITE REQUIREMENTS, AND FOR COORDINATING ALL PORTIONS OF THE PHASED WORK UNDER THE CONTRACT UNLESS OTHER SPECIFIC INSTRUCTIONS CONCERNING THESE MATTERS HAVE BEEN PROVIDED THROUGH THE DEVELOPER.
3. REFER TO THE CIVIL DRAWINGS FOR ALL SITE DIMENSIONS, GRADING AND EROSION CONTROL, UTILITY INFORMATION, LANDSCAPE AND IRRIGATION DESIGN AND ALL OTHER REQUIRED SITE RELATED IMPROVEMENTS.
4. PRIOR TO PROCEEDING WITH ROUGH GRADING, THE G.C. SHALL COORDINATE CIVIL GRADES WITH ELEVATIONS SPECIFIED AS PART OF THE ARCHITECTURAL SCOPE OF WORK (INCLUDING, BUT NOT LIMITED TO COMPARISON OF TOP OF FINISH GRADES AT PERIMETER OF BUILDING, FLAT WORK AND ADJOINING SITE AREAS). ALL QUESTIONS SHALL BE SUBMITTED IN WRITING TO THE CIVIL ENGINEER AND ARCHITECT PRIOR TO START OF WORK.
5. THE G.C. SHALL ROUGH GRADE AND RE-COMPACT BUILDING PADS PER THE SOILS REPORT AS PART OF THE SITE SCOPE OF WORK.
6. ALL GRADING AND CONCRETE PAVING SHALL SLOPE AWAY FROM THE BUILDING. CONTACT THE DEVELOPER, ARCHITECT AND CIVIL ENGINEER IN WRITING REGARDING ANY AREAS THAT CANNOT SLOPE AWAY DUE TO EXISTING CONDITIONS.
7. THE G.C. SHALL VERIFY ALL SITE DIMENSIONS TO APPLICABLE BOUNDARIES AND SETBACK INFORMATION WITH PARCEL MAP ALTA SURVEY OF RECORD AND NOTIFY OWNER, ARCHITECT, AND CIVIL ENGINEER IN WRITING OF ANY QUESTIONS IN THIS REGARD.
8. THE G.C. SHALL COORDINATE ALL SITE UTILITY RUNS WITH THE APPROPRIATE UTILITY COMPANIES AND PER THE APPROVED SITE PLANS. UTILITY RUNS SHALL BE STUBBED 5'-0" FROM THE BUILDING PERIMETER AT THE LOCATION INDICATED IN THE APPROVED M.E.P. DRAWINGS.
9. THE G.C. SHALL PROTECT EXISTING CONDITIONS TO REMAIN FROM DAMAGE. DAMAGED ITEMS SHALL BE REPLACED, REPAIRED, OR RESTORED BY THE G.C. IF, IN THE OPINION OF THE G.C., EXISTING CONDITIONS TO REMAIN WILL BE DAMAGED OR REQUIRE REMOVAL, THE GENERAL CONTRACTOR SHALL IDENTIFY THESE TO THE DEVELOPER PRIOR TO PROCEEDING WITH REMOVAL.
10. REFER TO CIVIL SITE PLANS FOR SITE LIGHTING TO BE COMPLETED IN DESIGN PHASE.
11. BOLLARDS SHALL BE PROVIDED AS VEHICLE PROTECTION TO PLAYGROUND WHERE PARKING IS ADJACENT TO PLAY AREA.
12. BOLLARDS TO BE ARRANGED AT 5' O.C.; WHEN BOLLARDS ARE PLACED AS PROTECTION AT HEAD ON PARKING LOT, THEY ARE TO BE CENTERED AT EACH SPOT.

Subject: FW: FOIA Request- 1268 West Street Southington

In addition to the Fire Department specific FOIA request, to address the FOIA request sent to the Town Clerk:

Our records indicate that 1268 West street is currently occupied by The Learning Experience Daycare and, as a daycare, the occupancy must be inspected by the Fire Marshal's office every year. The most recent inspection occurred on 4/1/24 and there were no violations noted.

Thank you,

Krysta Tsangarides
Administrative Assistant
Southington Fire Department
310 North Main st
Southington, CT 06489

Good Morning All,

Please see FOIA request attached. I have already sent an acknowledgement to Mr. Kerpez. Once you have compiled all pertinent information for your department, please email directly to him and copy FOIA_Requests@southington.org on the email so that I can note completion of the request.

Thank you,
Town of Southington
